# Topological groups，$k$－networks，and weak topology 

广西大学刘川（Chuan Liu）${ }^{1}$<br>神奈川大学 酒井政美（Masami Sakai）<br>東京学芸大学 田中祥雄（Yoshio Tanaka）

Let $G$ be a topological group．Then，we give affirmative answers to（Q1）， and partial answers to（Q2）and（Q3）in the following questions．
（Q1）（A）Let $G$ have a $\sigma$－hereditarily closure－preserving $k$－network．Is $G$ an $\aleph$－space ？
（B）Let $G$ be a $k$－space with a star－countable $k$－network．Is $G$ an $\aleph$－space ？
（Q2）Let $G$ be the quotient $s$－image of a metric space．Is $G$ paracompact （or，meta－Lindelöf）？
（Q3）（A．V．Arhangelskii）．Let $G$ be a sequential space．Does $G$ contain no（closed）copy of $S_{\omega_{1}}$ ？

Let us recall some definitions which will be used in this paper．
A family $\left\{A_{\alpha}: \alpha \in I\right\}$ of subsets of a space $X$ is hereditarily closure－ preserving（simply，HCP）if $\bigcup\left\{c l B_{\alpha}: \alpha \in J\right\}=c l\left(\bigcup\left\{B_{\alpha}: \alpha \in J\right\}\right)$ ，whenever $J \subset I$ and $B_{\alpha} \subset A_{\alpha}$ for each $\alpha \in J$ ．

Let $\mathcal{P}$ be a cover of a space $X$ ．Then， $\mathcal{P}$ is a $k$－network for $X$ ，if whenever $K \subset U$ with $K$ compact and $U$ open in $X, K \subset \cup \mathcal{P}^{\prime} \subset U$ for some finite $\mathcal{P}^{\prime} \subset \mathcal{P}$ ．When a $k$－network $\mathcal{P}$ is a closed cover，then $\mathcal{P}$ is called a closed $k$－network．

Recall that a space is an $\aleph$－space（resp．$\aleph_{0}$－space）if it has a $\sigma$－locally finite $k$－network（resp．countable $k$－network）．

Following［GMT］，a space $X$ is determined by a cover $\mathcal{C}$ ，if $F \subset X$ is closed in $X$ iff $F \cap C$ is closed in $C$ for every $C \in \mathcal{C}$ ．We use＂$X$ is determined by $\mathcal{C} "$ instead of the usual＂$X$ has the weak topology with respect to $\mathcal{C}$ ＂．Obviously，every space $X$ is determined by any open cover，or any HCP closed cover of $X$ ．

[^0]A space is a $k$-space (resp. sequential space) if it is determined by a cover of compact subsets (resp. compact metric subsets). As is well-known, every $k$-space (resp. sequential space) is precisely the quotient image of a locally compact space (resp. (locally compact) metric space).

A space $X$ has countable tightness $(=t(X) \leq \omega)$ if, whenever $x \in c l A$, then $x \in c l B$ for some countable subset $B$ with $B \subset A$. As is well-known, $t(X) \leq \omega$ iff $X$ is determined by a cover of countable subsets.

Let us recall canonical quotient spaces $S_{\alpha}$, and the Arens' space $S_{2}$.
For an infinite cardinal $\alpha, S_{\alpha}$ is the space obtained from the topological sum of $\alpha$ convergent sequences by identifying all the limit points to a single point. In paricular, $S_{\omega}$ is called the sequential fan.

Let $L=\left\{a_{n}: n \in \omega\right\}$ be an infinite sequence with a limit point $\infty \notin L$. Let $L_{n}(n \in \omega)$ be an infinite sequence with a limit point $a_{n} \notin L_{n}$. Then, $S_{2}$ is the space obtained from the topological sum of $L$ and these $L_{n}$ by identifying each $a_{n} \in L$ with the limit point $a_{n}$ of $L_{n}$.

We assume that spaces are regular and $\mathrm{T}_{1}$, and maps are continuous and onto.

## Results

Lemma 1. ([JZ]) Let $X$ be a space with a $\sigma$-HCP $k$-network. Then, $X$ is an $\aleph$-space if and only if $X$ contains no (closed) copy of $S_{\omega_{1}}$.

Every Fréchet space $X$ with a $\sigma$-HCP $k$-network (equivalently, $X$ is a Lašnev space [F]) need not be an $\aleph$-space; see Example 16(1). But, we have the following among topological groups.

Theorem 2. Let $G$ be a topological group. If $G$ has a $\sigma$-HCP $k$-network, then $G$ is an $\aleph$-space. (Affirmative answer to (A) in (Q1))

Corollary 3. Let $G$ be a topological group which is the closed image of an $\aleph$-space. Then, $G$ is an $\aleph$-space.

Remark 4. For a space $X$, the following decomposition theorems hold. (1) is due to $[\mathrm{M}]$ or $[\mathrm{Ln}]$, and (2) is due to [LT1].
(1) Let $X$ be a space with a $\sigma$-HCP $k$-network. Then $X$, as well as every closed image of $X$, is decomposed into a $\sigma$-discrete space and an $\aleph$-space.
(2) Let $X$ be a Fréchet space with a star-countable $k$-network (more gen-
generally, point-countable $k$-network of separable subsets). Then $X$ is decomposed into a closed discrete space and a space which is the topological sum of $\aleph_{0}$-spaces. (The Fréchetness of $X$ is essential; see Example 16(2)).

Let us consider topological groups having certain point-countable covers. The parenthetic part is due to [NT].

Lemma 5. Let $t(X) \leq \omega$. If $X$ contains a copy of $S_{\omega_{1}}$ (resp. $\left.S_{\omega}\right)$, then $X$ contains a closed copy of $S_{\omega_{1}}$ (resp. $S_{\omega}$ ).

For an infinite cardinal $\alpha$, a space $X$ is $\alpha$-compact if every subset of cardinality $\alpha$ has an accumulation point in $X$. Clearly, Lindelöf spaces (resp. countably compact spaces) are $\omega_{1}$-compact (resp. $\omega$-compact).

Corollary 6. Let $t(X) \leq \omega$. If $X$ is determined by a point-countable (resp. point-finite) cover of $\omega_{1}$-compact (resp. $\omega$-compact) subsets, then $X$ contains no copy of $S_{\omega_{1}}$ (resp. $S_{\omega}$ ).

In particular, $S_{\omega_{1}}$ (resp. $S_{\omega}$ ) can not be embedded into any $\omega_{1}$-compact (resp. $\omega$-compact) space of countable tightness.

Let us say that a cover $\mathcal{P}$ of $X$ is a cs-cover of $X$ if, for every infinite convergent sequence $C$ in $X$, some $P \in \mathcal{P}$ contains at least two points of $C$. We note that $S_{\omega_{1}}$ has a point-countable $c s$-cover of two-point sets.

Theorem 7. Let $G$ be a sequential group with a point-countable $c s$-cover of $\omega_{1}$-compact subsets. Then, $G$ contains no copy of $S_{\omega_{1}}$. (Partial answer to (Q3)).

Corollary 8. Let $G$ be sequential group with a point-countable $k$ network of $\omega_{1}$-compact subsets. Then, $G$ contains no copy of $S_{\omega_{1}}$.

Lemma 9. Let $G$ be a sequential topological group satisfying (a) and (b) below. Then, $G$ is the topological sum of $\omega_{1}$-compact subsets.

In particular, if each element of $\mathcal{F}$ is cosmic (resp. compact), then $G$ is the topological sum of cosmic subspaces (resp. $\sigma$-compact subspaces). Here, a space is cosmic if it has a countable network.
(a) $G$ contains no (closed) copy of $S_{\omega_{1}}$.
(b) $G$ has a point-countable cover $\mathcal{F}$ such that $\mathcal{F}^{*}=\left\{\cup \mathcal{F}^{\prime}: \mathcal{F}^{\prime} \subset \mathcal{F}, \mathcal{F}^{\prime}\right.$ is finite\} determines $G$; and, any finite product of elements of $\mathcal{F}$ is $\omega_{1}$-compact.

Theorem 10. Let $G$ be a topological group. If $G$ is a $k$-space with a
point-countable $k$-network $\mathcal{P}$ of cosmic subspaces, then $G$ is the topological sum of cosmic subspaces.

In particular, if $G$ is a $k$-space with a star-countable $k$-network, then $G$ is the topological sum of $\aleph_{0}$-subspaces. (Affirmative answer to (B) in (Q1)).

Remark 11. In the previous theorem, the property " $G$ is a $k$-space " is essential. According to [Tk2], under ( CH ) there exists a countably compact topological group $G$ in which every compact set is finite, but $G$ is not metrizable (cf. [Tk1]). Hence, the topological group $G$ has a star-countable $k$-network of singletons, but not even a $\sigma$-space.

Let us recall that every CW-complex, more generally, every space dominated by $k$-and- $\aleph_{0}$-subspaces is a $k$-space with a star-countable $k$-network ([IT]). (Conversely, every $k$-space with a star-countable $k$-network is a space dominated by $k$-and- $\aleph_{0}$-subspaces ([S])). Then, the following holds by Theorem 7 and [T3; Corollary 6].

Corollary 12. Let $K$ be a topological group. If $K$ is a CW-complex, then $K$ is the topological sum of countable CW-subcomplexes.

In the previous corollary, "K is a topological group " is essential, and the topological group $K$ need not be metrizable; see Example 16.

Now, every quotient finite-to-one image of a locally compact metric space need not be paracompact, nor even meta-Lindelöf; see [GMT; Example 9.3]. But, we have the following among topological groups.

Theorem 13. Let $f: X \rightarrow G$ be a quotient $s$-map such that $X$ is a locally separable metric space. If $G$ is a topological group, then $G$ is a paracompact space (actually, $G$ is the topological sum of cosmic subspaces). (Partial answer to (Q2)).

In the previous theorem, the topological group $G$ need not be metrizable by Example 16(3).

Similarly, we have the following since $G$ is determined by a point-countable cover of compact subsets.

Theorem 14. Let $f: X \rightarrow G$ be a quotient $s$-map such that $X$ is a locally compact paracompact space. If $G$ is a sequential topological group, then $G$ is a paracompact space (actually, $G$ is the topological sum of $\sigma$ compact subspaces).

Remark 15. Let $G$ be a topological group. Then, $G$ is metrizable if the following (a), (b), or (c) holds. (Cf. [LST]).
(a) $G$ is a $k$-space with a point-countable $k$-network, and $G$ contains no closed copy of $S_{\omega}$, or no $S_{2}$.
(b) $G$ is the quotient compact image of a metric space.
(c) $G$ is a Fréchet space with a point-countable $k$-network. In párticular, $G$ is a Lašnev space, or a Fréchet space which is the quotient $s$-image of a metric space.

Example 16. (1) A Lašnev CW-complex $K$, but $K$ is not an $\aleph$-space.
(2) A CW-complex $K$ which is not Fréchet, and $K$ has the following properties. (Cf. [LT1]).
(a) $K$ contains no copy of $S_{\omega}$.
(b) $K$ has a point-countable closed $k$-network.
(c) $K$ has a star-countable $k$-network of separable metric subsets.
(d) $K$ can not be decomposed into a $\sigma$-discrete space and a space with a $\sigma$-HCP $k$-network, or star-countable closed $k$-network.
(3) A topological group $G$ which is a countable CW-complex (hence, an $\aleph_{0}$-space), and $G$ is the quotient countable-to-one image of a locally compact, separable metric space. But, $G$ is not metrizable, not even Fréchet.
