# AN INVITATION TO THE SIMILARITY PROBLEMS (AFTER PISIER) 

NARUTAKA OZAWA

#### Abstract

This note is intended as a handout for the minicourse given in RIMS workshop "Operator Space Theory and its Applications" on January 31, 2006.

## 1. The Similarity Problems

1.1. The similarity problem for continuous homomorphisms. In this note, we mainly consider unital $\mathrm{C}^{*}$-algebras and unital (not necessarily *-preserving) homomorphisms for the sake of simplicity. Let $A$ be a unital $\mathrm{C}^{*}$-algebra and $\pi: A \rightarrow \mathbb{B}(\mathcal{H})$ be a unital homomorphism with $\|\pi\|<\infty$. We say that $\pi$ is similar to a $*$-homomorphism if there exists $S \in \operatorname{GL}(\mathcal{H})$ such that $\operatorname{Ad}(S) \circ \pi$ is a $*$-homomorphism. Here, $\mathrm{GL}(\mathcal{H})$ is the set of invertible element in $\mathbb{B}(\mathcal{H})$ and $\operatorname{Ad}(S)(x)=S x S^{-1}$.
Similarity Problem A (Kadison 1955). Is every continuous homomorphism similar to a $*$-homomorphism?

We note that a homomorphism $\pi$ is a $*$-homomorphism iff $\|\pi\|=1$, since an element $x \in \mathbb{B}(\mathcal{H})$ is unitary iff $\|x\|=\left\|x^{-1}\right\|=1$. We say $A$ has the similarity property (abbreviated as (SP)) if every unital continuous homomorphism from $A$ into $\mathbb{B}(\mathcal{H})$ is similar to a $*$-homomorphism. Do we really need the assumption that $\pi$ is continuous? That is another problem. Indeed, the subject of automatic continuity is extensively studied in Banach algebra theory, and it is known that the existence of a discontinuous homomorphism from a $\mathrm{C}^{*}$-algebra into some Banach algebra is independent of (ZFC). As far as the author knows, it is not known whether or not the automatic continuity of a homomorphism between $\mathrm{C}^{*}$-algebras (say, with a dense image) is provable within (ZFC).

Similarity Problem A is equivalent to several long-standing problems in C*, von Neumann and operator theories. Among them is the Derivation Problem;
Derivation Problem. Is every derivation $\delta: A \rightarrow \mathbb{B}(\mathcal{H})$ inner?
Let $A \subset \mathbb{B}(\mathcal{H})$ be a (unital) $\mathrm{C}^{*}$-algebra. A derivation $\delta: A \rightarrow \mathbb{B}(\mathcal{H})$ is a linear map which satisfies the derivative identity $\delta(a b)=\delta(a) b+a \delta(b)$. The celebrated theorem of Kadison and Sakai is that every derivation into $A^{\prime \prime}$ is inner. We recall

Date: February 20, 2006.
that $\delta: A \rightarrow \mathbb{B}(\mathcal{H})$ is said to be inner if there exists $T \in \mathbb{B}(\mathcal{H})$ such that

$$
\forall a \in A \quad \delta(a)=\delta_{T}(a):=T a-a T
$$

It is known that every derivation is automatically continuous (Ringrose). We say $A$ has the (DP) if any derivation $\delta: A \rightarrow \mathbb{B}(\mathcal{H})$, for any faithful $*$-representation $A \subset \mathbb{B}(\mathcal{H})$, is inner.

Theorem 1.1 (Kirchberg 1996). Let $A$ be a unital $C^{*}$-algebra. Then $A$ has the (SP) iff A has the (DP).

The easier implication (SP) $\Rightarrow$ (DP) (which precedes Kirchberg) follows from the following lemma.

Lemma 1.2. Let $A \subset \mathbb{B}(\mathcal{H})$ be a unital $C^{*}$-algebra and $\delta: A \rightarrow \mathbb{B}(\mathcal{H})$ be a derivation. Then the homomorphism $\pi: A \rightarrow \mathbb{M}_{2}(\mathbb{B}(\mathcal{H}))$ defined by

$$
\pi(a)=\left(\begin{array}{cc}
a & \delta(a) \\
0 & a
\end{array}\right)
$$

is similar to $a *$-homomorphism iff $\delta$ is inner.
Proof. We first observe that $\pi$ is indeed a homomorphism since $\delta$ is a derivation. If $\delta=\delta_{T}$, then we have

$$
\pi(a)=\left(\begin{array}{ll}
1 & T \\
0 & 1
\end{array}\right)\left(\begin{array}{ll}
a & 0 \\
0 & a
\end{array}\right)\left(\begin{array}{cc}
1 & -T \\
0 & 1
\end{array}\right)
$$

and $\pi$ is similar to a $*$-homomorphism $\operatorname{id}_{A} \oplus \operatorname{id}_{A}$. We now suppose that $\sigma(a)=$ $S \pi(a) S^{-1}$ is a $*$-homomorphism. Let $D=S^{*} S$. Since

$$
\left\|S^{-1}\right\|^{2}\langle D \xi, \xi\rangle=\left\|S^{-1}\right\|^{2}\|S \xi\|^{2} \geq\|\xi\|^{2}
$$

we have $D \geq\left\|S^{-1}\right\|^{-2}$. Since $\sigma$ is $*$-preserving, we have

$$
D \pi(a)=S^{*} \sigma(a) S=\left(S^{*} \sigma\left(a^{*}\right) S\right)^{*}=\pi\left(a^{*}\right)^{*} D
$$

for every $a \in A$. Developing the equation, we get

$$
\left(\begin{array}{ll}
D_{11} & D_{12} \\
D_{21} & D_{22}
\end{array}\right)\left(\begin{array}{cc}
a & \delta(a) \\
0 & a
\end{array}\right)=\left(\begin{array}{cc}
a & 0 \\
\delta\left(a^{*}\right)^{*} & a
\end{array}\right)\left(\begin{array}{ll}
D_{11} & D_{12} \\
D_{21} & D_{22}
\end{array}\right)
$$

Looking at the ( 1,1 )-entry, we have $D_{11} a=a D_{11}$ for every $a \in A$. Combined with $D_{11} \geq\left\|S^{-1}\right\|^{-2}$, this implies that $D_{11}^{-1} \in A^{\prime}$ with $\left\|D_{11}^{-1}\right\| \leq\left\|S^{-1}\right\|^{2}$. Looking at the ( 2,1 )-entry, we have

$$
D_{11} \delta(a)+D_{12} a=a D_{12}
$$

It follows that $\delta=\delta_{T}$ for $T=-D_{11}^{-1} D_{12}$ with $\|T\| \leq\|S\|^{2}\left\|S^{-1}\right\|^{2}$.
1.2. Known cases and open cases. The important result of Haagerup (1983) is that a continuous homomorphism $\pi: A \rightarrow \mathbb{B}(\mathcal{H})$ admitting a finite cyclic subset (i.e., there exists a finite subset $\mathcal{F} \subset \mathcal{H}$ such that $\operatorname{span}\{\pi(a) \xi: a \in A, \xi \in \mathcal{F}\}$ is dense in $\mathcal{H}$ ), is inner. This does not finish the similarity problem since we cannot decompose a general (non $*$-preserving) representation into a direct sum of cyclic representations.

Theorem 1.3. The following $C^{*}$-algebras have the (SP).
(1) Nuclear $C^{*}$-algebras.
(2) $C^{*}$-algebras without tracial states (Haagerup).
(3) Type $\mathrm{I}_{1}$ factors with the property $(\Gamma)$ (Christensen).

We note that one may reduce Similarity problem A (or derivation problem) for $\mathrm{C}^{*}$-algebras to that for type $\mathrm{II}_{1}$ factors by considering the second dual, then considering the type decomposition and direct integration. We do not know whether or not the von Neumann algebras $\mathcal{L F} \mathbb{F}_{2}$ and $\prod_{n=1}^{\infty} \mathbb{M}_{n}$ have the (SP). We suspect that $\prod_{n=1}^{\infty} \mathbb{M}_{n}$ should be a counterexample.
1.3. The similarity problem for group representations. We only consider discrete groups. Let $\Gamma$ be a discrete group and $C^{*} \Gamma$ be the full group $C^{*}$-algebra. We regard $\Gamma$ as the corresponding subgroup of unitary elements in $C^{*} \Gamma$. Every continuous homomorphism $\pi: C^{*} \Gamma \rightarrow \mathbb{B}(\mathcal{H})$ gives rise to a uniformly bounded (abbreviated as u.b.) representation of $\Gamma$ on $\mathcal{H} ; \pi: \Gamma \rightarrow \mathrm{GL}(\mathcal{H})$ is a group homomorphism such that $\|\pi\|:=\sup _{s \in \Gamma}\|\pi(s)\|<\infty^{1}$. Obviously, the homomorphism $\pi: C^{*} \Gamma \rightarrow \mathbb{B}(\mathcal{H})$ is similar to a $*$-homomorphism iff the representation $\pi_{\mid \Gamma}$ is unitarizable (i.e., $\exists S \in \mathrm{GL}(\mathcal{H})$ such that $\operatorname{Ad}(S) \circ \pi_{\mid \Gamma}$ is a unitary representation).

Theorem 1.4 (Diximier 1950). Let $\Gamma$ be an amenable group. Then, every u.b. representation of $\Gamma$ is unitarizable. More precisely, if $\pi: \Gamma \rightarrow \mathrm{GL}(\mathcal{H})$ is a u.b. representation, then there exists $S \in \mathrm{GL}(\mathcal{H}) \cap \operatorname{vN}(\pi(\Gamma))$ with $\|S\|\left\|S^{-1}\right\| \leq\|\pi\|^{2}$ such that $\operatorname{Ad}(S) \circ \pi$ is unitary.

Proof. Let $\Gamma$ be amenable and $\pi: \Gamma \rightarrow \mathrm{GL}(\mathcal{H})$ be a u.b. representation. Let $F_{n} \subset \Gamma$ be a Følner net. Since $\pi$ is u.b., the set $\left|F_{n}\right|^{-1} \sum_{s \in F_{n}} \pi(s)^{*} \pi(s) \in \mathrm{vN}(\pi(\Gamma))$ has a weak*-accumulation point. Since the accumulation point is positive, we let $S$ be the the square root of it. Then, we have

$$
\|S \xi\|^{2}=\lim _{n} \frac{1}{\left|F_{n}\right|} \sum_{s \in F_{n}}\|\pi(s) \xi\|^{2},
$$

and hence $\|\pi\|^{-1} \leq S \leq\|\pi\|$ and $\|S \pi(s) \xi\|=\|S \xi\|$ for every $s \in \Gamma$ and $\xi \in \mathcal{H}$. It follows that $\|\operatorname{Ad}(S) \circ \pi\|=1$ and hence $\operatorname{Ad}(S) \circ \pi$ is unitary.

[^0]If one employ the fact that a nuclear $\mathrm{C}^{*}$-algebra is amenable as a Banach algebra (Haagerup 1983), then we can adopt the above proof to the case of nuclear $\mathrm{C}^{*}$ algebras. We say $\Gamma$ is unitarizable if every u.b. representation of $\Gamma$ is unitarizable. Pisier $(2004,2005)$ proved that if $\Gamma$ is unitarizable and in addition that the similarity $S$ can be chosen so that (i) $S \in \mathrm{GL}(\mathcal{H}) \cap \mathrm{vN}\left(\pi(\Gamma)\right.$ ), or (ii) $\|S\|\left\|S^{-1}\right\| \leq\|\pi\|^{2}$, then $\Gamma$ is amenable. However, the following is still open.
Similarity Problem B. Is every unitarizable group amenable?
Theorem 1.5. The free group $\mathbb{F}_{\infty}$ on countably many generators is not unitarizable.

Proof. We denote by $|t|$ the word length of $t \in \mathbb{F}_{\infty}$, by $\mathbb{C F}_{\infty}$ the space of all finitely supported $\mathbb{C}$-valued functions on $\mathbb{F}_{\infty}$, and by $\lambda(s)$ the left translation operator by $s$ on $\ell_{\infty} \Gamma$ (and its subspaces). Let $B: \mathbb{C F}_{\infty} \rightarrow \ell_{\infty} \mathbb{F}_{\infty}$ be the linear map defined by

$$
B \delta_{t}=\sum\left\{\delta_{t^{\prime}}:\left|t^{-1} t^{\prime}\right|=1,\left|t^{\prime}\right|=|t|+1\right\},
$$

i.e., $B \delta_{t}$ is the characteristic function of those points which are just one-step ahead of $t$ (looking from $e$ ). Then, for every $s \in \mathbb{F}_{\infty}$, we have

$$
(B \lambda(s)-\lambda(s) B) \delta_{t}=\left\{\begin{array}{ll}
0 & \text { if }|s| \neq|s t|+\left|t^{-1}\right| \\
\delta_{s(|s t|+1)}-\delta_{s(|s t|-1)} & \text { if }|s|=|s t|+\left|t^{-1}\right|
\end{array},\right.
$$

where $s(k)$ is the unique element such that $|s(k)|=k$ and $|s|=|s(k)|+\left|s(k)^{-1} s\right|$. Hopefully, the figures below explain the above equation. It follows that we may

Figure 1. $|s| \neq|s t|+\left|t^{-1}\right|$

Figure 2. $|s|=|s t|+\left|t^{-1}\right|$
view $D(s)=B \lambda(s)-\lambda(s) B$ as an element in $\mathbb{B}\left(\ell_{2} \mathbb{F}_{\infty}\right)$ with $\|D(s)\|=2$. Thus, $D: \mathbb{F}_{\infty} \rightarrow \mathbb{B}\left(\ell_{2} \mathbb{F}_{\infty}\right)$ is a u.b. derivation; $D(s t)=D(s) \lambda(t)+\lambda(s) D(t)$. It is not hard to show that $D$ is not inner, i.e., there is no $B_{0} \in \mathbb{B}\left(\ell_{2} \mathbb{F}_{\infty}\right)$ such that $B-B_{0}$ commutes with every $\lambda(s)$ (in $L\left(\mathbb{C F}_{\infty}, \ell_{\infty} \mathbb{F}_{\infty}\right)$ ). We define a u.b. representation $\pi: \mathbb{F}_{\infty} \rightarrow \mathbb{M}_{2}\left(\mathbb{B}\left(\ell_{2} \mathbb{F}_{\infty}\right)\right)$ by

$$
\pi(s)=\left(\begin{array}{cc}
\lambda(s) & D(s) \\
0 & \lambda(s)
\end{array}\right)
$$

We conclude the proof by using the fact, which is proved in the same way to Lemma 1.2, that $\pi$ is similar to $*$-homomorphism only if $D$ is inner.

We observe that a subgroup of a unitarizable group is again unitarizable thanks to the fact that the induction of a u.b. representation is again u.b. (and a little more effort). Hence a counterexample (if any) to Similarity Problem B has to be a non-amenable group which does not contain $\mathbb{F}_{2}$ as a subgroup. Do you think this might be a good time to stop chasing the problem?

## 2. Isomorphic Characterization of Injectivity

2.1. A free Khinchine inequality. Let $\Gamma$ be a discrete group and $\mathcal{L} \Gamma$ be its group von Neumann algebra. By definition, the map

$$
\mathcal{L} \Gamma \ni \lambda(f) \mapsto f=\lambda(f) \delta_{e} \in \ell_{2} \Gamma
$$

is contractive. For which operator space structure on $\ell_{2} \Gamma$, does the above map completely bounded? We briefly review the column and row Hilbert space structures. Let $\mathcal{H}$ be a Hilbert space. When it is viewed as a column vector space, we say it is a column Hilbert space and denote it by $\mathcal{H}_{C}$, i.e., $\mathcal{H}_{C}=\mathbb{B}(\mathbb{C}, \mathcal{H})$ as an operator space. For any finite sequence ${ }^{2}\left(x_{i}\right)_{i}$ in $\mathbb{B}(H)$ and orthonormal vectors $\xi_{1}, \ldots, \xi_{n} \in \mathcal{H}$, we have

$$
\left\|\left(x_{i}\right)_{i}\right\|_{C}:=\left\|\sum_{i} x_{i} \otimes \xi_{i}\right\|_{\mathbb{B}(H) \otimes \mathcal{H}_{C}}=\left\|\left(\begin{array}{c}
x_{1} \\
x_{2} \\
\vdots
\end{array}\right)\right\|=\left\|\sum_{i} x_{i}^{*} x_{i}\right\|^{1 / 2}
$$

Likewise, we define the row Hilbert space as $\mathcal{H}_{R}=\mathbb{B}(\overline{\mathcal{H}}, \mathbb{C})$, where $\overline{\mathcal{H}}$ is the conjugate Hilbert space of $\mathcal{H}$. For any finite sequence $\left(x_{i}\right)$ in $\mathbb{B}(H)$ and orthonormal vectors $\xi_{1}, \ldots, \xi_{n} \in \mathcal{H}$, we have

$$
\left\|\left(x_{i}\right)_{i}\right\|_{R}:=\left\|\sum_{i} x_{i} \otimes \xi_{i}\right\|_{\mathbb{B}(H) \otimes \mathcal{H}_{R}}=\left\|\left(\begin{array}{lll}
x_{1} & x_{2} & \cdots
\end{array}\right)\right\|=\left\|\sum_{i} x_{i} x_{i}^{*}\right\|^{1 / 2} .
$$

We regard the following lemma trivial and use it without referring it.
Lemma 2.1. For any finite sequences $\left(a_{i}\right)_{i}$ and $\left(b_{i}\right)_{i}$ in $\mathbb{B}(\mathcal{H})$, we have

$$
\left\|\sum_{i} a_{i} b_{i}\right\| \leq\left\|\left(a_{i}\right)_{i}\right\|_{R}\left\|\left(b_{i}\right)_{i}\right\|_{C}
$$

In particular, $\left\|\sum a_{i} \otimes b_{i}\right\| \leq \min \left\{\left\|\left(a_{i}\right)_{i}\right\|_{R}\left\|\left(b_{i}\right)_{i}\right\|_{C},\left\|\left(a_{i}\right)_{i}\right\|_{C}\left\|\left(b_{i}\right)_{i}\right\|_{R}\right\}$.
We define $\mathcal{H}_{C \cap R}=\left\{\xi \oplus \xi \in \mathcal{H}_{C} \oplus \mathcal{H}_{R}: \xi \in \mathcal{H}\right\}$.
Proposition 2.2. The map

$$
\mathcal{L} \Gamma \ni \lambda(f) \mapsto f \in\left(\ell_{2} \Gamma\right)_{C \cap R}
$$

is completely contractive.

[^1]Proof. We view $\delta_{e} \in \mathbb{B}\left(\mathbb{C}, \ell_{2} \Gamma\right)$ and $\delta_{e}^{*} \in \mathbb{B}\left(\overline{\ell_{2} \Gamma}, \mathbb{C}\right)$. Since $f=\lambda(f) \delta_{e} \in \mathbb{B}\left(\mathbb{C}, \ell_{2} \Gamma\right)$, the above map is a complete contraction into $\mathcal{H}_{C}$. Since $f=\delta_{e}^{*} \bar{\lambda}(f) \in \mathbb{B}\left(\overline{\ell_{2} \Gamma}, \mathbb{C}\right)$, the above map is a complete contraction into $\mathcal{H}_{R}$ as well.

We simply write $C \cap R$ for $\left(\ell_{2}\right)_{C \cap R}$ and $\left\{\theta_{i}\right\}$ for a fixed orthonormal basis for $C \cap R$. For instance, we can take $\theta_{i}=e_{i 1} \oplus e_{1 i} \in \mathbb{B}\left(\ell_{2}\right) \oplus \mathbb{B}\left(\ell_{2}\right)$. For a finite sequence $\left(x_{i}\right)_{i}$ in $\mathbb{B}(\mathcal{H})$, we set

$$
\left\|\left(x_{i}\right)_{i}\right\|_{C \cap R}=\left\|\sum_{i} x_{i} \otimes \theta_{i}\right\|_{\mathbb{B}(\mathcal{H}) \otimes(C \cap R)}=\max \left\{\left\|\left(x_{i}\right)_{i}\right\|_{C},\left\|\left(x_{i}\right)_{i}\right\|_{R}\right\} .
$$

The following is the rudiment of free Khinchine inequalities.
Theorem 2.3 (Haagerup and Pisier 1993). Let $\mathbb{F}_{\infty}$ be the free group on countable generators, $\mathcal{S}=\left\{s_{i}\right\} \subset \mathbb{F}_{\infty}$ be the standard set of free generators and

$$
E_{\lambda}=\overline{\operatorname{span}}\left\{s_{i}\right\} \subset \mathcal{L} \mathbb{F}_{\infty}
$$

be an operator subspace. Then, the map

$$
\Phi: C \cap R \ni \theta_{i} \mapsto \lambda\left(s_{i}\right) \in \mathcal{L} \mathbb{F}_{\infty}
$$

is completely bounded with $\|\Phi\|_{\mathrm{cb}} \leq 2$. In particular, the projection $Q$ from $\mathcal{L F}{ }_{\infty}$ onto $E_{\lambda}$, defined by

$$
Q: \mathcal{L} \mathbb{F}_{\infty} \ni \lambda(s) \mapsto\left\{\begin{array}{ll}
\lambda(s) & \text { if } s \in \mathcal{S} \\
0 & \text { if } s \notin \mathcal{S}
\end{array},\right.
$$

is completely bounded with $\|Q\|_{\mathrm{cb}} \leq 2$.
Proof. For each $i$, let $\Omega_{i}^{ \pm} \subset \mathbb{F}_{\infty}$ be the subsets of all reduced words which begins with respectively $s_{i}^{ \pm 1}$, and $P_{i}^{ \pm} \in \mathbb{B}\left(\ell_{2} \mathbb{F}_{\infty}\right)$ be the orthogonal projection onto $\ell_{2} \Omega_{i}^{ \pm}$. Then, for each $i$, we have

$$
\lambda\left(s_{i}\right)=\lambda\left(s_{i}\right) P_{i}^{-}+\lambda\left(s_{i}\right)\left(1-P_{i}^{-}\right)=\lambda\left(s_{i}\right) P_{i}^{-}+P_{i}^{+} \lambda\left(s_{i}\right) .
$$

Therefore for any finite sequence $\left(x_{i}\right)_{i} \subset \mathbb{B}(H)$, we have

$$
\left\|\sum_{i} x_{i} \otimes \lambda\left(s_{i}\right) P_{i}^{-}\right\|_{\mathbb{B}\left(H \otimes \ell_{2} \mathbb{F}_{\infty}\right)} \leq\left\|\left(x_{i}\right)_{i}\right\|_{R}\left\|\left(\lambda\left(s_{i}\right) P_{i}^{-}\right)_{i}\right\|_{C} \leq\left\|\left(x_{i}\right)_{i}\right\|_{R}
$$

since $\left\|\left(\lambda\left(s_{i}\right) P_{i}^{-}\right)_{i}\right\|_{C}=\left\|\sum_{i} P_{i}^{-}\right\|^{1 / 2}=1$. Likewise, we have

$$
\left\|\sum_{i} x_{i} \otimes P_{i}^{+} \lambda\left(s_{i}\right)\right\|_{\mathbb{B}\left(H \otimes \ell_{2} \mathbb{F}_{\infty}\right)} \leq\left\|\left(x_{i}\right)_{i}\right\|_{C}\left\|\left(P_{i}^{+} \lambda\left(s_{i}\right)\right)_{i}\right\|_{R} \leq\left\|\left(x_{i}\right)_{i}\right\|_{C} .
$$

It follows that

$$
\left\|\sum_{i} x_{i} \otimes \lambda\left(s_{i}\right)\right\|_{\mathbb{B}\left(H \otimes \ell_{2} \mathbb{F}_{\infty}\right)} \leq 2\left\|\left(x_{i}\right)_{i}\right\|_{C \cap R}=2\left\|\sum_{i} x_{i} \otimes \theta_{i}\right\| .
$$

This means that $\|\Phi\|_{\mathrm{cb}} \leq 2$. The second assertion follows from Proposition 2.2.

Remark 2.4. The above property of $\mathcal{L} \mathbb{F}_{\infty}$ is related to the fact that $\mathcal{L F}{ }_{\infty}$ is not injective. We simply write $E_{n}$ for $\left(\ell_{2}^{n}\right)_{C \cap R}$. Thus

$$
E_{n}=\operatorname{span}\left\{e_{i 1} \oplus e_{1 i}: i=1, \ldots, n\right\} \subset \mathbb{M}_{n} \oplus \mathbb{M}_{n}
$$

It is known that $E_{n}$ is far from injective, i.e., any projection from $\mathbb{M}_{n} \oplus \mathbb{M}_{n}$ onto $E_{n}$ has cb-norm $\geq \frac{1}{2}(\sqrt{n}+1)$. It follows that if $M$ is an injective von Neumann algebra, then any maps $\alpha: E_{n} \rightarrow M$ and $\beta: M \rightarrow E_{n}$ with $\beta \circ \alpha=\operatorname{id}_{E_{n}}$ satisfy $\|\alpha\|_{\text {cb }}\|\beta\|_{c b} \geq$ $\frac{1}{2}(\sqrt{n}+1)$. It is conjectured(?) by Pisier that for any non-injective von Neumann algebra $M$, there exist sequences of maps $\alpha_{n}: E_{n} \rightarrow M$ and $\beta_{n}: M \rightarrow E_{n}$ such that $\beta_{n} \circ \alpha_{n}=\operatorname{id}_{E_{n}}$ and $\sup \left\|\alpha_{n}\right\|_{\text {cb }}\left\|\beta_{n}\right\|_{c b}<\infty$. An affirmative answer would solve several problems around operator spaces (e.g., whether existence of a bounded linear projection from $\mathbb{B}(\mathcal{H})$ onto $M$ implies injectivity of $M$.) A negative answer would lead to a non-injective type $\mathrm{II}_{1}$ factor which does not contain $\mathcal{L} \mathbb{F}_{2}$.
2.2. Isomorphic characterization of injective von Neumann algebras. For a finite sequence $\left(x_{i}\right)_{i}$ in $\mathbb{B}(\mathcal{H})$, we set

$$
\left\|\left(x_{i}\right)_{i}\right\|_{C+R}=\left\|\Phi: C \cap R \ni \theta_{i} \mapsto x_{i} \in \mathbb{B}(\mathcal{H})\right\|_{\mathrm{cb}} .
$$

We say that a von Neumann algebra $M$ has the property $(\mathrm{P})^{3}$ if there exists a constant $C_{M}>0$ with the following property; For any finite sequence $\left(x_{i}\right)_{i}$ in $M$ with $\left\|\left(x_{i}\right)_{i}\right\|_{C+R} \leq 1$, there exist finite sequences $\left(a_{i}\right)_{i}$ and $\left(b_{i}\right)_{i}$ in $M$ such that

$$
\left\|\left(a_{i}\right)_{i}\right\|_{C} \leq C_{M},\left\|\left(b_{i}\right)_{i}\right\|_{R} \leq C_{M} \text { and } x_{i}=a_{i}+b_{i} \text { for every } i .
$$

Theorem 2.5 (Pisier 1994). A von Neumann algebra $M$ is injective iff it has the property (P).

The "if" part requires several lemmas, and we first prove the "only if" part. Let $M$ be an injective von Neumann algebra and consider a complete contraction $\Phi: C \cap R \ni \theta_{i} \mapsto x_{i} \in M$. Since $M$ is injective, this map extends to a complete contraction $\tilde{\Phi}: C \oplus R \rightarrow M$, where $C=\overline{\operatorname{span}}\left\{e_{i 1}\right\}$ and $R=\overline{\operatorname{span}}\left\{e_{1 i}\right\}$. Then $a_{i}=\tilde{\Phi}\left(0 \oplus e_{1 i}\right)$ and $b_{i}=\tilde{\Phi}\left(e_{i 1} \oplus 0\right)$ satisfies the required condition with $C_{M}=1$. We note that $\left\|\left(\varphi\left(a_{i}\right)\right)_{i}\right\|_{C} \leq\|\varphi\|_{\mathrm{cb}}\left\|\left(a_{i}\right)_{i}\right\|_{C}$ for any cb-map $\varphi$ and any finite sequence $\left(a_{i}\right)_{i}$. Hence the following is trivial.

Lemma 2.6. The property $(\mathrm{P})$ inherits to a von Neumann subalgebra which is the range of a completely bounded projection.

As a corollary to Theorem 2.5, we see that a von Neumann subalgebra $M \subset \mathbb{B}(\mathcal{H})$ which is the range of a completely bounded projection is in fact injective. We observe that by the type decomposition and the Takesaki duality, it suffices to show Theorem 2.5 for a von Neumann algebra of type $\mathrm{II}_{1}$.

Let $M \subset \mathbb{B}(\mathcal{H})$ be a von Neumann algebra. An $M$-central state is a state $\varphi$ on $\mathbb{B}(\mathcal{H})$ such that $\varphi\left(u x u^{*}\right)=\varphi(x)$ for $u \in M$ and $x \in \mathbb{B}(\mathcal{H})$ (or equivalently

[^2]$\varphi(a x)=\varphi(x a)$ for $a \in M$ and $x \in \mathbb{B}(\mathcal{H}))$. Recall that the celebrated theorem of Connes states that a finite von Neumann algebra $M$ is injective iff there exists an $M$-central state $\varphi$ such that $\varphi_{\mid M}$ is a faithful normal tracial state.
Lemma 2.7. Let $M \subset \mathbb{B}(\mathcal{H})$. Then, there exists an $M$-central state if
$$
\left\|\sum_{i=1}^{n} u_{i} \otimes \overline{u_{i}}\right\|_{\mathbb{B}(\mathcal{H} \otimes \overline{\mathcal{H}})}=n
$$
for every $n$ and unitary elements $u_{1}, \ldots, u_{n} \in M$.
Proof. We first recall that $\overline{\mathcal{H}}$ is the complex conjugate Hilbert space of $\mathcal{H}$ and $\bar{x} \in \mathbb{B}(\overline{\mathcal{H}})$ means the element associated with $x \in \mathbb{B}(\mathcal{H})$. We have the canonical identification between the Hilbert space $\mathcal{H} \otimes \overline{\mathcal{H}}$ and the space $\mathcal{S}_{2}(\mathcal{H})$ of the HilbertSchmidt class operators on $\mathcal{H}$, given by $\xi \otimes \bar{\eta} \leftrightarrow\langle\cdot, \eta\rangle \xi \in \mathcal{S}_{2}(\mathcal{H})$. Under this identification, $\sum a_{i} \otimes \overline{b_{i}}$ acts on $\mathcal{S}_{2}(\mathcal{H})$ as $\mathcal{S}_{2}(\mathcal{H}) \ni h \mapsto \sum a_{i} h b_{i}^{*} \in \mathcal{S}_{2}(\mathcal{H})$.

Let $u_{1}, \ldots, u_{n} \in M$ be unitary elements such that $u_{1}=1$. If $\left\|\sum_{i=1}^{n} u_{i} \otimes \overline{u_{i}}\right\|=n$, then there exists a unit vector $h \in \mathcal{S}_{2}(\mathcal{H})$ such that $\left\|\sum_{i=1}^{n} u_{i} h u_{i}^{*}\right\|_{2} \approx n$. By uniform convexity, we must have $\left\|u_{i} h u_{i}^{*}-h\right\|_{2} \approx 0$ for every $i$. This implies that $\left\|u_{i} h^{*} h u_{i}-h^{*} h\right\|_{1} \approx 0$ for every $i$. It follows that $\varphi(x)=\operatorname{Tr}\left(h^{*} h x\right)$ defines a state on $\mathbb{B}(\mathcal{H})$ such that $\left\|\varphi \circ \operatorname{Ad}\left(u_{i}\right)-\varphi\right\|_{\mathbb{B}(\mathcal{H})_{*}} \approx 0$ for every $i$. Therefore, taking appropriate limit, we can obtain an $M$-central state.

Lemma 2.8 (Haagerup 1985). Let $M$ be a von Neumann algebra. Assume that there exists a constant $c>0$ with the following property; For every n, unitary elements $u_{1}, \ldots, u_{n} \in M$ and every non-zero central projection $p \in M$, we have

$$
\left\|\sum_{i=1}^{n} p u_{i} \otimes \overline{p u_{i}}\right\|_{\mathbb{B}(p \mathcal{H} \otimes \overline{p \mathcal{H}})} \geq c n
$$

Then, $M$ is injective.
Proof. Let $u_{1}, \ldots, u_{n} \in M$ be unitary elements and $p \in M$ be a non-zero central projection. By assumption, we have

$$
\left\|\left(\sum_{i=1}^{n} p u_{i} \otimes \overline{p u_{i}}\right)^{k}\right\|_{\mathbb{B}(p \mathcal{H} \otimes \overline{p \mathcal{H}})} \geq c n^{k}
$$

for every positive integer $k$. Therefore, we actually have that

$$
\left\|\sum_{i=1}^{n} p u_{i} \otimes \overline{p u_{i}}\right\|_{\mathbb{B}(p \mathcal{H} \otimes \overline{p \mathcal{H}})} \geq \lim _{k \rightarrow \infty} c^{1 / k} n=n .
$$

By Lemma 2.7 , there exists a $p M$-central state $\varphi_{p}$ on $\mathbb{B}(p M)$ for every non-zero central projection $p \in M$. Fix a normal faithful tracial state $\tau$ on $M$. For any finite
partition $\mathcal{P}=\left\{p_{i}\right\}_{i}$ of unity by central projections in $M$, we define the $M$-central state $\varphi_{\mathcal{P}}$ on $\mathbb{B}(\mathcal{H})$ by

$$
\varphi_{\mathcal{P}}(x)=\sum_{i} \tau\left(p_{i}\right) \varphi_{p_{i}}\left(p_{i} x p_{i}\right) .
$$

Taking appropriate limit of $\varphi_{\mathcal{P}}$, we obtain an $M$-central state $\varphi$ on $\mathbb{B}(\mathcal{H})$ such that $\varphi_{\mid M}=\tau$. We conclude that $M$ is injective by Connes's theorem.

For a finite sequence $\left(x_{i}\right)_{i}$ in $\mathbb{B}(\mathcal{H})$, we set

$$
\left\|\left(x_{i}\right)_{i}\right\|_{O H}=\left\|\sum_{i} x_{i} \otimes \overline{x_{i}}\right\|_{\mathbb{B}(\mathcal{H} \otimes \overline{\mathcal{H}})}^{1 / 2} .
$$

We note that $\left\|\left(x_{i}\right)_{i}\right\|_{O H} \leq\left\|\left(x_{i}\right)_{i}\right\|_{R}^{1 / 2}\left\|\left(x_{i}\right)_{i}\right\|_{C}^{1 / 2} \leq\left\|\left(x_{i}\right)_{i}\right\|_{C \cap R}$. Besides those appearing in Lemma 2.1, we have the following mysterious inequality (which manifests the self-dual property of the operator Hilbert spaces).

Lemma 2.9. For every finite sequences $\left(a_{i}\right)_{i}$ in $\mathbb{B}(\mathcal{H})$ and $\left(b_{i}\right)_{i}$ in $\mathbb{B}(\mathcal{K})$, we have

$$
\left\|\sum_{i} a_{i} \otimes b_{i}\right\|_{\mathbb{B}(\mathcal{H} \otimes \mathcal{K})} \leq\left\|\left(a_{i}\right)_{i}\right\|_{O H}\left\|\left(b_{i}\right)_{i}\right\|_{O H}
$$

Proof. We may assume that $\mathcal{K}=\overline{\mathcal{H}}$ and use $\bar{b}_{i}$ in the place of $b_{i}$. Identifying $\mathcal{H} \otimes \mathcal{H}$ with $\mathcal{S}_{2}(\mathcal{H})$ as in the proof of Lemma 2.7, we see

$$
\left\|\sum_{i} a_{i} \otimes \overline{b_{i}}\right\|_{\mathbb{B}(\mathcal{H} \otimes \overline{\mathcal{H}})}=\sup \left\{\left|\sum_{i} \operatorname{Tr}\left(h a_{i} k b_{i}^{*}\right)\right|: h, k \in \mathcal{S}_{2}(\mathcal{H}) \text { with norm } 1\right\} .
$$

Let $h, k \in \mathcal{S}_{2}(\mathcal{H})$ with norm 1 be given. Then, we can find decompositions $h=h_{1} h_{2}$ and $k=k_{1} k_{2}$ such that $h_{j}, k_{j} \in \mathcal{S}_{4}(\mathcal{H})$ with norm 1. It follows that

$$
\begin{aligned}
\left|\sum_{i} \operatorname{Tr}\left(h a_{i} k b_{i}^{*}\right)\right| & =\left|\sum_{i} \operatorname{Tr}\left(\left(h_{2} a_{i} k_{1}\right)\left(k_{2} b_{i}^{*} h_{1}\right)\right)\right| \\
& \leq \operatorname{Tr}\left(\sum_{i} h_{2} a_{i} k_{1} k_{1}^{*} a_{i}^{*} h_{2}^{*}\right)^{1 / 2} \operatorname{Tr}\left(\sum_{i} h_{1}^{*} b_{i} k_{2}^{*} k_{2} b_{i}^{*} h_{1}\right)^{1 / 2} \\
& \leq\left\|\sum_{i} a_{i} \otimes \overline{a_{i}}\right\|_{\mathbb{B}(\mathcal{H} \otimes \overline{\mathcal{H}})}^{1 / 2}\left\|\sum_{i} b_{i} \otimes \overline{b_{i}}\right\|_{\mathbb{B}(\mathcal{H} \otimes \overline{\mathcal{H}})}^{1 / 2} .
\end{aligned}
$$

This proves the assertion.
Lemma 2.10. For every finite sequence $\left(x_{i}\right)_{i}$ in $\mathbb{B}(\mathcal{H})$, we have

$$
\left\|\left(x_{i}\right)_{i}\right\|_{C+R} \leq\left\|\left(x_{i}\right)_{i}\right\|_{O H} .
$$

Proof. Let $\Phi: C \cap R \ni \theta_{i} \mapsto x_{i} \in \mathbb{B}(\mathcal{H})$ and take $z=\sum_{i} a_{i} \otimes \theta_{i} \in \mathbb{B}(\mathcal{H}) \otimes(C \cap R)$. We note that $\|z\|=\left\|\left(a_{i}\right)_{i}\right\|_{C \cap R} \geq\left\|\left(a_{i}\right)_{i}\right\|_{O H}$. Hence, by Lemma 2.9, we have

$$
\|(\mathrm{id} \otimes \Phi)(z)\|=\left\|\sum a_{i} \otimes x_{i}\right\| \leq\left\|\left(a_{i}\right)_{i}\right\|_{O H}\left\|\left(x_{i}\right)_{i}\right\|_{O H} \leq\left\|\left(x_{i}\right)_{i}\right\|_{O H}\|z\| .
$$

This implies that $\left\|\left(x_{i}\right)_{i}\right\|_{C+R}=\|\Phi\|_{\mathrm{cb}} \leq\left\|\left(x_{i}\right)_{i}\right\|_{O H}$.

We have prepared enough lemmas for the proof of Theorem 2.5.
Proof of Theorem 2.5. It is left to show that a finite von Neumann algebra $M$ with the property $(\mathrm{P})$ is injective. To verify the assumption of Lemma 2.8, we give ourselves unitary elements $u_{1}, \ldots, u_{n} \in M$, a non-zero central projection $p \in M$ and a constant $c>0$ such that

$$
\left\|\left(p u_{i}\right)_{i}\right\|_{O H}^{2} \leq c n
$$

Then, by Lemma 2.10 and the property $(\mathrm{P})$, there exist $\left(a_{i}\right)_{i}$ and $\left(b_{i}\right)_{i}$ in $M$ such that $\left\|\left(a_{i}\right)_{i}\right\|_{C} \leq C_{M} \sqrt{c n},\left\|\left(b_{i}\right)_{i}\right\|_{R} \leq C_{M} \sqrt{c n}$ and $p u_{i}=a_{i}+b_{i}$ for every $i$. We fix a tracial state on $p M$ and denote by $\|\cdot\|_{2}$ the corresponding 2-norm. It follows that

$$
n=\sum_{i=1}^{n}\left\|p u_{i}\right\|_{2}^{2} \leq 2 \sum_{i=1}^{n}\left(\left\|a_{i}\right\|_{2}^{2}+\left\|b_{i}\right\|_{2}^{2}\right) \leq 2\left(\left\|\left(a_{i}\right)_{i}\right\|_{C}^{2}+\left\|\left(b_{i}\right)_{i}\right\|_{R}^{2}\right) \leq 2 C_{M}^{2} c n
$$

Therefore, we have $c \geq\left(2 C_{M}^{2}\right)^{-1}$ and we are done.
2.3. A characterization of nuclearity. Let $A$ be a (unital) $\mathrm{C}^{*}$-algebra. We say $A$ has the strong similarity property (abbreviated as (SSP)) if for every unital continuous homomorphism $\pi: A \rightarrow \mathbb{B}(\mathcal{H})$, there exists $S \in \operatorname{GL}(\mathcal{H}) \cap \operatorname{vN}(\pi(A))$ such that $\operatorname{Ad}(S) \circ \pi$ is a $*$-homomorphism.

Theorem 2.11 (Pisier 2005). A $C^{*}$-algebra $A$ is nuclear iff it has the (SSP).
Proof. As we remarked, the "only if" part follows from Diximier's proof + the amenability of nuclear C*-algebra. To prove the "if" part, let $A$ be a $\mathrm{C}^{*}$-algebra with the (SSP). By a standard direct sum argument, it is not hard to see that there exists a constant $C>0$ with the following property; Every unital continuous homomorphism $\pi: A \rightarrow \mathbb{B}(\mathcal{H})$ with $\|\pi\| \leq 5^{4}$, there exists $S \in \operatorname{GL}(\mathcal{H}) \cap \operatorname{vN}(\pi(A))$ with $\|S\|\left\|S^{-1}\right\| \leq C$ such that $\operatorname{Ad}(S) \circ \pi$ is a $*$-homomorphism. Let $A \subset \mathbb{B}(\mathcal{H})$ be a universal $*$-representation. It suffices to show that $A^{\prime}$ is injective. Let $\left(x_{i}\right)_{i}$ be a finite sequence in $A^{\prime}$ with $\left\|\left(x_{i}\right)_{i}\right\|_{C+R} \leq 1$. Since $\mathbb{B}(\mathcal{H})$ is injective, there exist $\left(c_{i}\right)_{i}$ and $\left(d_{i}\right)_{i}$ in $\mathbb{B}(\mathcal{H})$ such that $\left\|\left(c_{i}\right)_{i}\right\|_{C} \leq 1,\left\|\left(d_{i}\right)_{i}\right\|_{R} \leq 1$ and $x_{i}=c_{i}+d_{i}$ for every $i$. We define a derivation $\delta: A \rightarrow \mathbb{B}(\mathcal{H}) \bar{\otimes} \mathcal{L} \mathbb{F}_{\infty}$ by

$$
\delta(a)=\delta_{\sum c_{i} \otimes \lambda\left(s_{i}\right)}(a \otimes 1)=\sum_{i} \delta_{c_{i}}(a) \otimes \lambda\left(s_{i}\right) \in \mathbb{B}(\mathcal{H}) \otimes E_{\lambda} \subset \mathbb{B}(\mathcal{H}) \bar{\otimes} \mathcal{L} \mathbb{F}_{\infty}
$$

We recall from the proof of Theorem 2.3 that $\lambda\left(s_{i}\right)=u_{i}+v_{i}$ with $\left\|\left(u_{i}\right)\right\|_{C} \leq 1$ and $\left\|\left(v_{i}\right)\right\|_{R} \leq 1$. Since $\delta_{c_{i}}=\delta_{-d_{i}}$ on $A$, we have $\delta=\delta_{B}$, where $B=\sum\left(c_{i} \otimes v_{i}-d_{i} \otimes u_{i}\right)$

[^3]with $\|B\| \leq\left\|\left(c_{i}\right)_{i}\right\|_{C}\left\|\left(v_{i}\right)\right\|_{R}+\left\|\left(d_{i}\right)_{i}\right\|_{R}\left\|\left(u_{i}\right)\right\|_{C} \leq 2$. Hence, we have $\|\delta\|_{\mathrm{cb}} \leq 4$. We define a homomorphism $\pi: A \rightarrow \mathbb{M}_{2}\left(\mathbb{B}(\mathcal{H}) \bar{\otimes} \mathcal{L} \mathbb{F}_{\infty}\right)$ by
\[

\pi(a)=\left($$
\begin{array}{cc}
a \otimes 1 & \delta(a) \\
0 & a \otimes 1
\end{array}
$$\right)
\]

By the assumption on the (SSP), there exists an invertible element $S \in \mathrm{vN}(\pi(A))$ with $\|S\|\left\|S^{-1}\right\| \leq C$ such that $\operatorname{Ad}(S) \circ \pi$ is a $*$-homomorphism. By the proof of Lemma 1.2 , there exists $T \in \mathbb{B}(\mathcal{H}) \bar{\otimes} \mathcal{L} \mathbb{F}_{\infty}$ with $\|T\| \leq C^{2}$ such that $\delta(a)=$ $\delta_{T}(a \otimes 1)$. Let $Q: \mathcal{L F}{ }_{\infty} \rightarrow E_{\lambda}$ be the projection appearing in Theorem 2.3. Since $\delta(A) \subset \mathbb{B}(\mathcal{H}) \otimes E_{\lambda}$ and id $\otimes Q$ is $A$-linear, we have

$$
\delta(a)=(\mathrm{id} \otimes Q)(\delta(a))=\delta_{(\mathrm{id} \otimes Q)(T)}(a \otimes 1)
$$

for every $a \in A$. We write $(\mathrm{id} \otimes Q)(T)=\sum z_{i} \otimes \lambda\left(s_{i}\right)$. Then, by Lemma 2.1 and Theorem 2.3, we have

$$
\left\|\left(z_{i}\right)_{i}\right\|_{C \cap R} \leq\|(\operatorname{id} \otimes Q)(T)\| \leq\|Q\|_{\mathrm{cb}}\|T\| \leq 2 C^{2}
$$

Since $\lambda\left(s_{i}\right)$ 's are linearly independent, we have $\delta_{c_{i}}=\delta_{z_{i}}$, or equivalently $c_{i}-z_{i} \in A^{\prime}$. Therefore, we have $a_{i}=c_{i}-z_{i} \in A^{\prime}$ with

$$
\left\|\left(a_{i}\right)_{i}\right\|_{C} \leq\left\|\left(c_{i}\right)_{i}\right\|_{C}+\left\|\left(z_{i}\right)_{i}\right\|_{C} \leq 1+2 C^{2}
$$

and likewise $b_{i}=x_{i}-a_{i}=d_{i}+z_{i} \in A^{\prime}$ with $\left\|\left(b_{i}\right)_{i}\right\|_{R} \leq 1+2 C^{2}$. We conclude the injectivity of $A^{\prime}$ by Theorem 2.5.

We say a group $\Gamma$ has the (SSP) if for every u.b. representation $\pi: \Gamma \rightarrow \operatorname{GL}(\mathcal{H})$, there exists $S \in \mathrm{GL}(\mathcal{H}) \cap \mathrm{vN}(\pi(\Gamma))$ such that $\operatorname{Ad}(S) \circ \pi$ is a unitary representation.
Corollary 2.12. A discrete group $\Gamma$ is amenable iff it has the (SSP).
Proof. This follows from the fact that $\Gamma$ is amenable iff $C^{*} \Gamma$ is nuclear.

## 3. Similarity Length of $\mathrm{C}^{*}$-algebras

The following is the fundamental characterization of a homomorphism which is similar to a $*$-homomorphism. This has several applications to dilation theory.
Theorem 3.1 (Haagerup, Paulsen). Let $A$ be a unital $C^{*}$-algebra (or just a unital operator algebra), $\pi: A \rightarrow \mathbb{B}(\mathcal{H})$ be a unital homomorphism and $C>0$ be a constant. Then, $\|\pi\|_{\mathrm{cb}} \leq C$ iff there exists $S \in \mathrm{GL}(\mathcal{H})$ with $\|S\|\left\|S^{-1}\right\| \leq C$ such that $\|\operatorname{Ad}(S) \circ \pi\|_{\mathrm{cb}}=1$.

Proof. The "if" part is obvious. To prove the "only if" part, let $A \subset \mathbb{B}(H)$ and $\pi: A \rightarrow \mathbb{B}(\mathcal{H})$ be a homomorphism with $\|\pi\|_{\text {cb }} \leq C$. By a Stinespring type theorem, there exist a Hilbert space $\widehat{\mathcal{H}}$, a $*$-homomorphism $\sigma: \mathbb{B}(H) \rightarrow \mathbb{B}(\widehat{\mathcal{H}})$, and operators $V \in \mathbb{B}(\mathcal{H}, \widehat{\mathcal{H}}), W \in \mathbb{B}(\widehat{\mathcal{H}}, \mathcal{H})$ with $\|V\|\|W\| \leq\|\pi\|_{\text {cb }}$ such that

$$
\forall a \in A \quad \pi(a)=V \sigma(a) W
$$

Let $\mathcal{K}_{1}=\overline{\operatorname{span}}(\sigma(A) W \mathcal{H})$. The subspace $\mathcal{K}_{1}$ is $\sigma(A)$-invariant and we may assume that $V=V P_{\mathcal{K}_{1}}$. Since

$$
V \sigma(a)(\sigma(x) W \xi)=\pi(a x) \xi=\pi(a) V \sigma(x) W \xi
$$

we have $V \sigma(a) P_{\mathcal{K}_{1}}=\pi(a) V$ for every $a \in A$. It follows that $\mathcal{K}_{2}=\operatorname{ker} V \subset \mathcal{K}_{1}$ is also $\sigma(A)$-invariant. Hence $\mathcal{L}=\mathcal{K}_{1} \ominus \mathcal{K}_{2}$ is "semi-invariant" under $\sigma(A)$, i.e.,

$$
\forall a \in A \quad P_{\mathcal{L}} \sigma(a)=P_{\mathcal{L}} \sigma(a) P_{\mathcal{L}}
$$

Consequently, we have

$$
\forall a \in A \quad \pi(a)=V P_{\mathcal{L}} \sigma(a) W=V P_{\mathcal{L}} \sigma(a) P_{\mathcal{L}} W
$$

Since $V P_{\mathcal{L}}$ is injective on $\mathcal{L}$ and $V P_{\mathcal{L}} W=\pi(1)=1$, the operator $S=V P_{\mathcal{L}}$ is a linear isomorphism from $\mathcal{L}$ onto $\mathcal{H}$ with $S^{-1}=P_{\mathcal{L}} W$. We have $\pi=\operatorname{Ad}(S) \circ \sigma$ with $\|S\|\left\|S^{-1}\right\| \leq C$ and, since $\mathcal{L} \cong \mathcal{H}$, we are done.

Corollary 3.2. A derivation $\delta$ is inner iff it is completely bounded.
By a standard direct sum argument, we obtain the following.
Corollary 3.3. Let $A$ be a unital $C^{*}$-algebra with the (SP). Then, there exists a function $f$ on $[1, \infty)$ such that

$$
\|\pi\|_{\mathrm{cb}} \leq f(\|\pi\|)
$$

for every unital continuous homomorphism $\pi: A \rightarrow \mathbb{B}(\mathcal{H})$.
Definition 3.4. Let $A$ be a unital $\mathrm{C}^{*}$-algebra (or a unital operator algebra). The similarity length of $A$, denoted by $l(A)$, is the smallest integer $l$ with the following property; There exists a constant $C>0$ such that for any $x \in \mathbb{M}_{\infty}(A)$, there exist $\alpha_{0}, \alpha_{1}, \ldots \alpha_{l} \in \mathbb{M}_{\infty}(\mathbb{C})$ and $D_{1}, \ldots, D_{l} \in \operatorname{Diag}_{\infty}(A)$ satisfying

$$
x=\alpha_{0} D_{1} \alpha_{1} \cdots D_{l} \alpha_{l}
$$

and

$$
\prod_{m=0}^{l}\left\|\alpha_{m}\right\| \prod_{m=1}^{l}\left\|D_{m}\right\| \leq C\|x\|
$$

Here, $\mathbb{M}_{\infty}(A)=\bigcup_{n=1}^{\infty} \mathbb{M}_{n}(A)$ and $\operatorname{Diag}_{\infty}(A) \subset \mathbb{M}_{\infty}(A)$ is the set of diagonal matrices with entries in $A$. If there is no $l$ satisfying the above condition, then we set $l(A)=\infty$ by convention.

Theorem 3.5 (Pisier 1999). Let $A$ be a unital $C^{*}$-algebra (or a unital operator algebra) with $\operatorname{dim}(A)>1$. The following are equivalent.
(1) A has the (SP).
(2) There exist $d>0$ and $C>0$ such that $\|\pi\|_{\mathrm{cb}} \leq C\|\pi\|^{d}$ for every unital continuous homomorphism $\pi: A \rightarrow \mathbb{B}(\mathcal{H})$.
(3) $l(A) \leq d$.

The constant $d$ appearing in the conditions (2) and (3) are taken to be same and are possibly non-integer. It follows that the "optimal" function $f$ appearing in Corollary 3.3 is a polynomial of degree $l(A)$. The implication $(2) \Rightarrow(1)$ follows from Theorem 3.1. We do not prove the hard implication $(1) \Rightarrow(3)$, but explain $(3) \Rightarrow(2)$;

$$
\|\pi(x)\|=\left\|\alpha_{0} \pi\left(D_{1}\right) \alpha_{1} \cdots \pi\left(D_{l}\right) \alpha_{l}\right\| \leq\|\pi\|^{l} \prod_{m=0}^{l}\left\|\alpha_{m}\right\| \prod_{m=1}^{l}\left\|D_{m}\right\| \leq C\|\pi\|^{l}\|x\|
$$

for $x=\alpha_{0} D_{1} \alpha_{1} \cdots D_{l} \alpha_{l} \in \mathbb{M}_{\infty}(A)$.
For a unital C*-algebra $A$ with $\operatorname{dim}(A)>1$, it is known that
(1) $l(A)=1 \Leftrightarrow \operatorname{dim}(A)<\infty$ (Exercise),
(2) $l(A)=2 \Leftrightarrow A$ is nuclear with $\operatorname{dim}(A)=\infty$ (Pisier 2004),
(3) $l(A) \leq 3$ if $A$ has no tracial state,
(4) $l(M)=3$ if $M$ is a type $\mathrm{II}_{1}$ factor with the property $(\Gamma)$ (Christensen 2002),
(5) $l(A)=\max \{l(I), l(A / I)\}$ for every closed 2-sided ideal $I \triangleleft A$ (Exercise).

It is not known whether there exists a unital $\mathrm{C}^{*}$-algebra with $l(A)>3$. We note that an affirmative answer to Similarity Problem A would imply that there exists $l_{0}$ such that $l(A) \leq l_{0}$ for every $\mathrm{C}^{*}$-algebra $A$. We close this note by showing $l(A) \leq 3$ for any $\mathrm{C}^{*}$-algebra $A$ which contains a unital copy of the Cuntz algebra $\mathcal{O}_{\infty}$. (The case where $A$ has no tracial state is then dealt by passing to the second dual.)

Let $x \in \mathbb{M}_{n}(A)$ be given. We choose unitary matrices $W_{1}, W_{2} \in \mathbb{M}_{n}(\mathbb{C})$ with $\left|W_{1}(i, j)\right|=\left|W_{2}(i, j)\right|=n^{-1 / 2}$ for all $i, j$ (e.g., $\left.W_{k}(i, j)=n^{-1 / 2} \exp (2 \pi \sqrt{-1} i j / n)\right)$. Let $D_{1}(i)=S_{i}^{*}$ and $D_{3}(j)=S_{j}$ for every $i, j$, where $S_{i}$ 's are isometries satisfying $S_{i}^{*} S_{j}=\delta_{i, j} I$. For every $k$, we set

$$
\begin{aligned}
D_{2}(k) & =n \sum_{i, j} \overline{W_{1}(i, k)} S_{i} x_{i, j} S_{j}^{*} \overline{W_{2}(k, j)} \\
& =n\left(\begin{array}{lll}
\overline{W_{1}(1, k)} S_{1} & \cdots & \overline{W_{1}(n, k)} S_{n}
\end{array}\right)\left(\begin{array}{ccc}
x_{1,1} & \cdots & x_{1, n} \\
\vdots & \ddots & \vdots \\
x_{n, 1} & \cdots & x_{n, n}
\end{array}\right)\left(\begin{array}{c}
\overline{W_{2}(k, 1)} S_{1}^{*} \\
\vdots \\
\overline{W_{2}(k, n)} S_{n}^{*}
\end{array}\right) .
\end{aligned}
$$

From the latter expression, we see that $\left\|D_{2}(k)\right\| \leq\|x\|$. We obtained $W_{1}, W_{2} \in$ $\mathbb{M}_{n}(\mathbb{C})$ and $D_{1}, D_{2}, D_{3} \in \operatorname{Diag}_{n}(A) \subset \mathbb{M}_{n}(A)$ such that

$$
\left\|D_{1}\right\|\left\|W_{1}\right\|\left\|D_{2}\right\|\left\|W_{2}\right\|\left\|D_{3}\right\| \leq\|x\|
$$

and

$$
x=D_{1} W_{1} D_{2} W_{2} D_{3} .
$$

Indeed, we have

$$
\begin{aligned}
\left(D_{1} W_{1} D_{2} W_{2} D_{3}\right)_{i, j}= & \sum_{k=1}^{n} S_{i}^{*} W_{1}(i, k) D_{2}(k) W_{2}(k, j) S_{j} \\
= & n \sum_{k=1}^{n}\left|W_{1}(i, k)\right|^{2}\left|W_{2}(k, j)\right|^{2} x_{i, j}=x_{i, j} . \\
& \quad \text { REFERENCES }
\end{aligned}
