**Abstract.** We use an old multilinear generalization of Grothendieck’s inequality (for which we give a new proof and a non-commutative version) to show that the Schatten space  $S_p$  is a  $Q$ -algebra with the Schur product for  $1 \leq p \leq 2$ .

### 1. Introduction and notation

In [10], Grothendieck stated what he called “the fundamental theorem of the metric theory of tensor products”, to be known later as Grothendieck’s theorem or Grothendieck’s inequality. In [14], Lindenstrauss and Pełczyński gave a detailed proof of this result and stated some of its consequences and equivalent formulations, making use of the theory of  $\mathcal{L}_p$ -spaces and using also the  $p$ -summing operators recently introduced in [18]. Since then, several equivalent formulations, extensions and different proofs have been obtained, together with innumerable applications. One of these extensions is the ‘non-commutative’ version given by Pisier (the interested reader can consult [13] or [22] for two recent applications). [8], [9] and [21] provide excellent expositions on this and related topics.

Grothendieck’s theorem can be seen as a matrix inequality associated to certain bilinear operators. In the late 70’s, several authors investigated multilinear extensions of Grothendieck’s matrix inequality (see, for instance, [3], [5], [24] and the references therein). Here, in Theorem 2.2, we give an elementary proof of one of these extensions (other proofs can be seen in [5] or [24]). In Corollary 2.3 we apply it to obtain that the Schatten space  $S_p$ , with  $1 \leq p \leq 2$  is a  $Q$ -algebra with the Schur product, answering (at least partially) an old problem that goes back to the work of Varopoulos in the 70’s. We refer to [16] for the history of the problem and the solution in the case  $2 \leq p \leq 4$ . Let us just say here that the case  $4 \leq p \leq \infty$  is still open. Motivated by this application, we give a non-commutative extension of Theorem 2.2 in the line of Pisier’s result.

The notation and terminology used along the paper are standard in Banach space theory, as for instance in [8] or [9]. These books are also our main references for basic facts, definitions and unexplained notation. However, before going any further, we shall establish some terminology. All along this paper all the operators

are supposed to be continuous. Given  $X, Y$  Banach spaces,  $\mathcal{L}(X, Y)$  will denote the Banach space of linear (and continuous) operators between them.  $X^*$  will be the dual of  $X$  and  $B_X$  its unit ball. For a finite sequence  $(x_i)_{i=1}^m \subset X$  and  $1 \leq p < \infty$ , we will write  $\|(x_i)_{i=1}^m\|_p^\omega$  to denote

$$\sup \left\{ \left( \sum_{i=1}^m |x^*(x_i)|^p \right)^{1/p} : x^* \in B_{X^*} \right\}.$$

A linear operator  $u: X \rightarrow Y$  is said to be absolutely summing if there exists a constant  $K > 0$  such that  $\sum_{i=1}^m \|u(x_i)\| \leq K \|(x_i)_{i=1}^m\|_1^\omega$  for each finite sequence  $(x_i)_{i=1}^m \subset X$ .  $\pi_1(u)$  will be the least of such constants  $K$ . We will use the fact that  $u: X \rightarrow Y$  is absolutely summing if and only if there exists a constant  $K > 0$  such that, for every  $m \in \mathbf{N}$ ,  $\|\text{id}_{l_1^m} \otimes u: l_1^m \otimes_\varepsilon X \rightarrow l_1^m \otimes_\pi Y\| \leq K$ , where  $\varepsilon$  and  $\pi$  denote the injective and projective tensor norms respectively [8, Proposition 11.1]. If so,  $\pi_1(u)$  is again the least of such constants. Grothendieck's theorem tells us that there exists a constant  $K > 0$  such that for every  $m \in \mathbf{N}$  and for every  $u: l_1^m \rightarrow l_2^m$ , we have that  $\pi_1(u) \leq K\|u\|$ . The Grothendieck constant  $K_G$  is the least of them.

More generally, given  $s, r_1, \dots, r_n \in [1, \infty)$  such that

$$\frac{1}{s} \leq \frac{1}{r_1} + \dots + \frac{1}{r_n},$$

we say that a multilinear operator  $T: X_1 \times \dots \times X_n \rightarrow Y$  is  $(s; r_1, \dots, r_n)$ -summing if there exists a constant  $K > 0$  such that

$$\left( \sum_{i=1}^m \|T(x_i^1, \dots, x_i^n)\|^s \right)^{1/s} \leq K \prod_{j=1}^n \|(x_i^j)_{i=1}^m\|_{r_j}^\omega$$

for every choice of sequences  $(x_i^j)_{i=1}^m \subset X_j$ . Again  $\|T\|_{(s; r_1, \dots, r_n)}$  will denote the least of such constants.

Let  $\lambda > 1$ . A Banach space  $X$  is said to be an  $\mathcal{L}_{\infty, \lambda}$ -space if, for every finite-dimensional subspace  $E \subset X$  there exists another finite-dimensional subspace  $F$ , with  $E \subset F \subset X$  and such that there exists an isomorphism  $v: F \rightarrow l_\infty^{\dim F}$  with  $\|v\| \|v^{-1}\| < \lambda$ . As basic examples we have that, for every compact Hausdorff space  $K$  and for every measure space  $(\Omega, \Sigma, \mu)$ ,  $C(K)$  and  $L_\infty(\mu)$  are  $\mathcal{L}_{\infty, \lambda}$ -spaces for every  $\lambda > 1$ .

A Banach algebra is said to be a uniform algebra if it is isometrically isomorphic (as Banach algebra) to a closed subalgebra of  $C(K)$  for some compact Hausdorff space  $K$ . By a  $Q$ -algebra we mean a commutative Banach algebra that is isomorphic (as Banach algebra) to  $C/I$ , where  $C$  is a uniform algebra and  $I$  a closed ideal of  $C$ . It is well known since the 60's that every  $Q$ -algebra is an

operator algebra, that is, isomorphic to a closed subalgebra of  $\mathcal{L}(H, H)$  for a Hilbert space  $H$ .

$S_\infty$  will be the Banach space of all compact operators on  $l_2$  (with the operator norm). The Schatten space  $S_p$ , with  $1 \leq p < \infty$ , will be the Banach space of all compact operators on  $l_2$  such that  $\text{tr}|u|^p < \infty$ , equipped with the norm  $\|u\|_{S_p} = (\text{tr}|u|^p)^{1/p}$ .

Finally, we have to define the Schur product in  $S_p$ . Using the canonical basis, any compact operator on  $l_2$  can be viewed as an infinite matrix  $(a_{k,h})_{k,h \geq 1}$ . The Schur product  $*$  of two such matrices is just the pointwise product, that is

$$(a_{k,h})_{k,h \geq 1} * (b_{k,h})_{k,h \geq 1} = (a_{k,h}b_{k,h})_{k,h \geq 1}.$$

### 2. The results

We will need the following

**Lemma 2.1.** *Let  $n, m \in \mathbf{N}$  and let  $u_i \in \mathcal{L}(l_1^m, l_2^m)$  with  $\|u_i\| \leq 1$ ,  $1 \leq i \leq n$ . We write  $i: l_1^m \hookrightarrow l_2^m$  for the formal inclusion and we write  $P_n: l_2^m \times \dots \times l_2^m \rightarrow l_1^m$  for the product operator  $P_n((x_i^1)_{i=1}^m, \dots, (x_i^n)_{i=1}^m) = (x_i^1 \cdots x_i^n)_{i=1}^m$  (and also for its associate linear operator  $P_n: l_2^m \otimes_\pi \dots \otimes_\pi l_2^m \rightarrow l_1^m$ ). If we define  $v_n$  with the following diagram*

$$\begin{array}{ccc} l_1^m \otimes_\varepsilon \dots \otimes_\varepsilon l_1^m & \xrightarrow{v_n} & l_2^m \\ u_1 \otimes \dots \otimes u_n \downarrow & & \uparrow i \\ l_2^m \otimes_\pi \dots \otimes_\pi l_2^m & \xrightarrow{P_n} & l_1^m \end{array}$$

Then  $\pi_1(v_n) \leq K_G^n$ .

*Proof.* We are going to prove it by induction. The case  $n = 1$  is obvious. For the general case, it is easy to see that the following diagram commutes

$$\begin{array}{ccc} (l_1^m \otimes_\varepsilon \dots \otimes_\varepsilon l_1^m) \otimes_\varepsilon l_1^m & \xrightarrow{v_{n+1}} & l_2^m \\ v_n \otimes \text{id} \downarrow & & \uparrow i \\ l_2^m \otimes_\pi l_1^m & & \\ \text{id} \otimes u_{n+1} \downarrow & & \\ l_2^m \otimes_\pi l_2^m & \xrightarrow{P_2} & l_1^m \end{array}$$

By the induction hypothesis,  $\pi_1(v_n) \leq K_G^n$ . Therefore  $\|v_n \otimes \text{id}\| \leq K_G^n$  and, thanks to Grothendieck's theorem, we obtain that

$$\pi_1(v_{n+1}) \leq \|v_n \otimes \text{id}\| \|\text{id} \otimes u_{n+1}\| \|P_2\| \pi_1(i) \leq K_G^{n+1}. \quad \square$$

Now, we can give our elementary proof of the following multilinear Grothendieck's inequality.

**Theorem 2.2.** For every  $m \in \mathbf{N}$ ,  $n \geq 2$ ,  $(a_{i_1 \dots i_n})_{i_j=1}^m \subset \mathbf{K}$  and  $x_{i_1}^1, \dots, x_{i_n}^n \in B_{l_2^m}$  we have

$$\left| \sum_{i_j=1}^m a_{i_1 \dots i_n} \sum_{k=1}^m x_{i_1}^1(k) \cdots x_{i_n}^n(k) \right| \leq K_G^{n-1} \sup_{|t_{i_j}| \leq 1} \left| \sum_{i_j=1}^m a_{i_1 \dots i_n} t_{i_1} \cdots t_{i_n} \right|.$$

*Proof.* Let us write  $z_{i_n} := \sum_{i_1, \dots, i_{n-1}=1}^m a_{i_1, \dots, i_n} e_{i_1} \otimes \cdots \otimes e_{i_{n-1}} \in l_1^m \otimes_{\varepsilon} \cdots \otimes_{\varepsilon} l_1^m$ . It is easy to see that:

$$\|(z_{i_n})_{i_n=1}^m\|_1^{\omega} = \sup \left\{ \left| \sum_{i_j=1}^m a_{i_1 \dots i_n} t_{i_1} \cdots t_{i_n} \right| : |t_{i_j}| \leq 1 \right\}.$$

For every  $j \in \{1, \dots, n-1\}$  we define the operator  $u_j: l_1^m \rightarrow l_2^m$ , by  $u_j(e_{i_j}) = x_{i_j}^j$ , ( $1 \leq i_j \leq m$ ). Since  $(e_{i_j})$  are the extremal points of the ball of  $l_1^m$  and since  $\|x_{i_j}^j\| \leq 1$ , we have that  $\|u_j\| \leq 1$ . Applying Lemma 2.1 we get

$$\sum_{i_n=1}^m \|v_{n-1}(z_{i_n})\| \leq K_G^{n-1} \|(z_{i_n})_{i_n=1}^m\|_1^{\omega}.$$

Finally,

$$\begin{aligned} \sum_{i_n=1}^m \|v_{n-1}(z_{i_n})\| &\geq \left| \sum_{i_n=1}^m \langle v_{n-1}(z_{i_n}), x_{i_n}^n \rangle \right| \\ &= \left| \sum_{i_1, \dots, i_n=1}^m a_{i_1, \dots, i_n} \sum_{k=1}^m x_{i_1}^1(k) \cdots x_{i_n}^n(k) \right|. \quad \square \end{aligned}$$

**Corollary 2.3.** For any  $1 \leq p \leq 2$ , the Schatten space with the Schur product  $(S_p, *)$  is a  $Q$ -algebra.

*Proof.* Davie's criterion (see [7]) tells us that a commutative Banach algebra  $A$  is a  $Q$ -algebra if and only if there exists a positive constant  $K$  such that

$$\left\| \sum_{i_1, \dots, i_n=1}^m a_{i_1, \dots, i_n} x_{i_1} \cdots x_{i_n} \right\| \leq K^n \sup_{|t_{i_j}| \leq 1} \left| \sum_{i_1, \dots, i_n=1}^m a_{i_1 \dots i_n} t_{i_1} \cdots t_{i_n} \right|,$$

for every sequence  $x_1, \dots, x_m \in A$  with  $\|x_i\| \leq 1$  and for every choice of  $a_{i_1 \dots i_n} \in \mathbf{C}$ . Therefore, it is enough to show that

$$\left\| \sum_{i_1, \dots, i_n=1}^m a_{i_1 \dots i_n} x_{i_1}^1 * \cdots * x_{i_n}^n \right\|_{S_p} \leq K_G^{n-1} \sup_{|t_{i_j}| \leq 1} \left| \sum_{i_1, \dots, i_n=1}^m a_{i_1 \dots i_n} t_{i_1} \cdots t_{i_n} \right|,$$

for each choice of  $a_{i_1 \dots i_n} \in \mathbf{C}$  and  $x_{i_1}^1, \dots, x_{i_n}^n \in B_{S_p}$ .

In fact, Davie's criterion follows for the particular case in which  $x_i^1 = \dots = x_i^n$  for every  $1 \leq i \leq m$ .

So let us choose  $a_{i_1 \dots i_n} \in \mathbf{C}$  and  $x_{i_1}^1, \dots, x_{i_n}^n \in B_{S_p}$ . [9, Theorem 4.7(a)] assures that  $\|x\|_{S_p} \leq \sum_{k,h=1}^\infty |x(k,h)|$  for each  $x = (x(k,h))_{k,h \geq 1} \in S_p$ . Therefore, we have that

$$\begin{aligned} \left\| \sum_{i_1, \dots, i_n=1}^m a_{i_1 \dots i_n} x_{i_1}^1 * \dots * x_{i_n}^n \right\|_{S_p} &\leq \sum_{k,h=1}^\infty \left| \sum_{i_1, \dots, i_n=1}^m a_{i_1 \dots i_n} x_{i_1}^1(k,h) \dots x_{i_n}^n(k,h) \right| \\ &= \sum_{k,h=1}^\infty \varepsilon_{k,h} \sum_{i_1, \dots, i_n=1}^m a_{i_1 \dots i_n} x_{i_1}^1(k,h) \dots x_{i_n}^n(k,h) \end{aligned}$$

for some  $|\varepsilon_{k,h}| = 1$ . Calling  $\bar{x}_i^1(k,h) = \varepsilon_{k,h} x_i^1(k,h)$  (trivially  $|\bar{x}_i^1(k,h)| = |x_i^1(k,h)|$  for every  $k,h$ ) and using Theorem 2.2 for  $(a_{i_1 \dots i_n})_{i_j=1}^m$  and  $\bar{x}_{i_1}^1, x_{i_2}^2, \dots, x_{i_n}^n$  we obtain

$$\begin{aligned} &\left\| \sum_{i_1, \dots, i_n=1}^m a_{i_1 \dots i_n} x_{i_1}^1 * \dots * x_{i_n}^n \right\|_{S_p} \\ &\leq K_G^{n-1} \sup_{|t_{i_j}| \leq 1} \left| \sum_{i_1, \dots, i_n=1}^m a_{i_1 \dots i_n} t_{i_1} \dots t_{i_n} \right| \prod_{j=1}^n \sup_{i_j} \left( \sum_{k,h=1}^\infty |x_{i_j}^j(k,h)|^2 \right)^{1/2}. \end{aligned}$$

Finally, for each  $1 \leq j \leq n$  and each  $1 \leq i_j \leq m$ , we have that

$$\left( \sum_{k,h=1}^\infty |x_{i_j}^j(k,h)|^2 \right)^{1/2} = \|x_{i_j}^j\|_{S_2} \leq \|x_{i_j}^j\|_{S_p} \leq 1,$$

and we are done.  $\square$

**Remark 2.4.** The previous corollary proves in fact that  $l_p \hat{\otimes}_\pi l_q$  and  $l_p(l_q)$  are also  $Q$ -algebras with the Schur product when  $1 \leq p, q \leq 2$ .

In the next corollary, in a completely different direction, we point out how Theorem 2.2 can be seen as a result concerning absolutely summing multilinear operators. It improves previous results of Botelho, Meléndez and Tonge in [4] and [15] and it has been recently used by Pellegrino in [17].

**Corollary 2.5.** *If  $X_j$  is an  $\mathcal{L}_{\infty, \lambda_j}$ -space ( $1 \leq j \leq n$ ), then every multilinear form  $T: X_1 \times \dots \times X_n \rightarrow \mathbf{K}$  is  $(1; 2 \dots, 2)$ -summing and  $\|T\|_{(1; 2, \dots, 2)} \leq K_G^{n-1} \prod_{j=1}^n \lambda_j \|T\|$  holds.*

*Proof.* The proof is quite standard. Because of the local behavior of the  $(1; 2, \dots, 2)$ -summing multilinear operators, it is enough to prove that if  $T: l_\infty^m \times \dots \times l_\infty^m \rightarrow \mathbf{K}$  is a multilinear form, then for every  $(x_r^j)_{r=1}^m \subset l_\infty^m$  such that  $\|(x_r^j)_{r=1}^m\|_2^\omega \leq 1$ , the following holds

$$\sum_{r=1}^m |T(x_r^1, \dots, x_r^m)| \leq K_G^{n-1} \|T\|.$$

Let us define  $T_{i_1, \dots, i_n} = T(e_{i_1}, \dots, e_{i_n})$  and

$$h_r = \sum_{i_1, \dots, i_n=1}^m T_{i_1 \dots i_n} x_r^1(i_1) \cdots x_r^n(i_n), \quad \theta_r = \begin{cases} \frac{|h_r|}{h_r}, & h_r \neq 0, \\ 0, & h_r = 0. \end{cases}$$

If  $y_{i_1}^1(r) = \theta_r x_r^1(i_1)$  and  $y_{i_j}^j(r) = x_r^j(i_j)$  for  $j \geq 2$ , we have that

$$\left( \sum_{r=1}^m |y_{i_j}^j(r)|^2 \right)^{1/2} \leq \left( \sum_{r=1}^m |x_r^j(i_j)|^2 \right)^{1/2} \leq \|(x_r^j)_{r=1}^m\|_2^\omega \leq 1.$$

Therefore  $y_{i_j}^j \in B_{l_2^m}$  and so, by Theorem 2.2,

$$\left| \sum_{i_1, \dots, i_n=1}^m T_{i_1 \dots i_n} \sum_{r=1}^m y_{i_1}^1(r) \cdots y_{i_n}^n(r) \right| \leq K_G^{n-1} \|T\|.$$

But

$$\begin{aligned} \left| \sum_{i_1, \dots, i_n=1}^m T_{i_1 \dots i_n} \sum_{r=1}^m y_{i_1}^1(r) \cdots y_{i_n}^n(r) \right| &= \left| \sum_{r=1}^m \theta_r \sum_{i_1, \dots, i_n=1}^m T_{i_1 \dots i_n} x_r^1(i_1) \cdots x_r^n(i_n) \right| \\ &= \sum_{r=1}^m |T(x_r^1, \dots, x_r^n)| \end{aligned}$$

and we are done.  $\square$

**Remark 2.6.** In [6] the authors use the fact that every  $n$ -linear form  $T: c_0 \times \dots \times c_0 \rightarrow \mathbf{K}$  is  $(1; 1, \dots, 1)$ -summing to obtain quite easily certain bounds for polynomials and multilinear forms on  $c_0$ , which had been obtained previously and with different techniques in [1], [2] and [25]. The above result could help to obtain better bounds along the same lines.

Finally, we are going to extend Theorem 2.2 to the non-commutative setting. To do that, we are going to use a tricky induction argument of [24] and several deep results of Haagerup, Pisier and Tomczak-Jaegermann. Though it is not the standard in the theory of  $C^*$ -algebras, following [21] we will denote  $|x|^2 = \frac{1}{2}(xx^* + x^*x)$  when  $x$  is an element of a  $C^*$ -algebra.

The starting point is the following non-commutative version of Grothendieck's theorem:

**Theorem 2.7** ([21, (9.3)]). *There exists a universal constant  $C$  such that, if  $A_1, A_2$  are  $C^*$ -algebras and  $T: A_1 \times A_2 \rightarrow \mathbf{C}$  is a bilinear form, we have that*

$$\sum_{i=1}^m |T(x_i^1, x_i^2)| \leq C \|T\| \left\| \sum_{i=1}^m |x_i^1|^2 \right\|^{1/2} \left\| \sum_{i=1}^m |x_i^2|^2 \right\|^{1/2}.$$

**Remark 2.8.** This result was proved for the first time in [20], in the presence of some approximation condition. The general case is due to Haagerup [11]. The formulation given in [20] and [11] is slightly different, but equivalent (as it is shown in [12, Remark 2.10(b)]).

To generalize it to the  $n$ -linear case, we need a pair of results. The first one is a consequence of [21, Theorem 4.1] and [23]. The other can be obtained easily from [21, Theorem 9.4].

**Theorem 2.9.** *Let  $A$  be a  $C^*$ -algebra and  $Y$  a finite-dimensional Banach space. For every linear operator  $u: A \rightarrow Y$  there exists a Hilbert space  $H$  and operators  $v: X \rightarrow H$  and  $w: H \rightarrow Y$  such that  $u = wv$  and*

$$\|w\| \|v\| \leq (4\sqrt{e} C_2(Y))^{3/2} \|u\|.$$

**Theorem 2.10.** *Let  $A$  be a  $C^*$ -algebra,  $H$  a Hilbert space and  $u: A \rightarrow H$  a linear operator. Then*

$$\sum_{i=1}^m \|u(x_i)\|^2 \leq 4 \|u\|^2 \left\| \sum_{i=1}^m |x_i|^2 \right\|,$$

for each finite sequence  $(x_i)_{i=1}^m \subset A$ .

So let us prove our result:

**Theorem 2.11.** *If  $A_1, \dots, A_n$  are  $C^*$ -algebras, every  $n$ -linear form  $T: A_1 \times \dots \times A_n \rightarrow \mathbf{C}$  satisfies*

$$\sum_{i=1}^m |T(x_i^1, \dots, x_i^n)| \leq C^{n-1} \|T\| \left\| \sum_{i=1}^m |x_i^1|^2 \right\|^{1/2} \cdots \left\| \sum_{i=1}^m |x_i^n|^2 \right\|^{1/2}$$

where  $C$  is an universal constant.

*Proof.* We are going to reason by induction. The case  $n = 2$  is Theorem 2.7. To prove the general case we can suppose  $\|T\| \leq 1$  and

$$\left\| \sum_{i=1}^m |x_i^j|^2 \right\|^{1/2} \leq 1 \quad \text{for every } 1 \leq j \leq n.$$

We consider the following operators:

$$\begin{aligned} u: l_2^m &\longrightarrow A_1, & u(e_i) &= x_i^1, \\ v: A_1 &\longrightarrow \mathcal{L}^{n-1}(A_2, \dots, A_n), & v(x^1) &= T(x^1, \cdot, \dots, \cdot), \\ w: \mathcal{L}^{n-1}(A_2, \dots, A_n) &\longrightarrow l_1^m, & w(S) &= (S(x_i^2, \dots, x_i^n))_{i=1}^m, \\ i: l_1^m &\hookrightarrow l_2^m, & i(e_i) &= e_i. \end{aligned}$$

Clearly  $\|v\| \leq 1$  and by the induction hypothesis  $\|w\| \leq C^{n-2}$ . Now, by Theorem 2.9 there exists a Hilbert space  $H$  and operators  $\tilde{v}: A_1 \longrightarrow H$ ,  $\tilde{w}: H \longrightarrow l_1^m$  such that  $\tilde{w}\tilde{v} = wv$  and  $\|\tilde{w}\| \leq C^{n-2}$ ,  $\|\tilde{v}\| \leq C'$ , where  $C'$  is a universal constant.

We can now consider  $\tilde{v}u: l_2^m \longrightarrow H$ . By Theorem 2.10,

$$\sum_{i=1}^m \|\tilde{v}u(e_i)\|^2 = \sum_{i=1}^m \|\tilde{v}(x_i^1)\|^2 \leq 4\|\tilde{v}\|^2 \left\| \sum_{i=1}^m |x_i^1|^2 \right\|.$$

Then, by [9, Corollary 4.8], the Hilbert–Schmidt norm of  $\tilde{v}u$  satisfies  $\|\tilde{v}u\|_{S_2} \leq 4C'$ . But, by Grothendieck’s theorem and [9, Theorem 4.10], it is also true that the Hilbert–Schmidt norm of  $i\tilde{w}: H \longrightarrow l_2^m$  satisfies  $\|i\tilde{w}\|_{S_2} \leq K_G C^{n-2}$ .

Therefore, by [19, Theorem 15.5.9], the composition  $i w v u: l_2^m \longrightarrow l_2^m$  satisfies that  $\|i w v u\|_{S_1} \leq 4K_G C' C^{n-2}$  and so  $\|i w v u\|_{S_1} \leq C^{n-1}$  if we choose  $C$  greater than  $4K_G C'$  and big enough to satisfy the case  $n = 2$ .

Using [19, Theorem 15.5.7], we can conclude that

$$\sum_{i=1}^m |T(x_i^1, \dots, x_i^n)| = \sum_{i=1}^m |(i w v u(e_i) | e_i)| \leq \|i w v u\|_{S_1} \leq C^{n-1}$$

where  $(\cdot | \cdot)$  denotes the scalar product in  $l_2^m$ .  $\square$

*Acknowledgement.* This paper was written while the author was visiting Kent State University to which thanks are acknowledged. The author would also like to thank F. Bombal, A. Tonge and I. Villanueva for many helpful conversations.
