# INTEGRABILITY OF DISTRIBUTIONS ON TWO KINDS OF MANIFOLD 

XIE LI AND WAN YONG

#### Abstract

In this paper, we give some sufficient and necessary conditions for integrability of distributions on an almost Hermitian manifold and a quasi Kaehlerian manifold, and generalize Bejancu's and WanYong's research work.

## 1. Introduction

Let $\bar{M}$ be a real differentiable manifold. An almost complex structure on $\bar{M}$ is a tensor field $J$ of type $(1,1)$ on $\bar{M}$ such that at every point $x \in \bar{M}$ we have $J^{2}=-I$, where $I$ denotes the identify transformation of $T_{x} \bar{M}$. A manifold $\bar{M}$ endowed with an almost complex structure is called an almost complex manifold.

A Hermitian metric on an almost complex manifold $\bar{M}$ is a Riemannian metric $g$ satisfying

$$
\begin{equation*}
g(J X, J Y)=g(X, Y) \tag{1.1}
\end{equation*}
$$

for any $X, Y \in \Gamma(T \bar{M})$.
An almost complex manifold endowed with a Hermitian metric is an almost Hermitian manifold. More, we defined the torsion tensor of J or the Nijenhuis tensor of J by

$$
\begin{equation*}
[J, J](X, Y)=[J X, J Y]-[X, Y]-J[J X, Y]-J[X, J Y], \tag{1.2}
\end{equation*}
$$

for any $X, Y \in \Gamma(T \bar{M})$, where $[X, Y]$ is the Lie bracket of vector fields $X$ and $Y$.

[^0]Definition 1.1 ([1]). An almost Hermitian manifold $\bar{M}$ with Levi-Civita connection $\bar{\nabla}$ is called a quasi-Kaehlerian manifold if we have

$$
\begin{equation*}
\left(\bar{\nabla}_{X} J\right) Y+\left(\bar{\nabla}_{J X} J\right) J Y=0, \tag{1.3}
\end{equation*}
$$

for any $X, Y \in \Gamma(T \bar{M})$.
Definition 1.2 ([1]). An almost Hermitian manifold $\bar{M}$ with Levi-Civita connection $\bar{\nabla}$ is called a Kaehlerian manifold if we have

$$
\begin{equation*}
\bar{\nabla}_{X} J=0, \tag{1.4}
\end{equation*}
$$

for any $X \in \Gamma(T \bar{M})$.
Obviously, a Kaehlerian manifold is a quasi-Kaehlerian manifold.
Let $M$ be an $m$-dimensional Riemannian submanifold of an $n$-dimensional Riemannian manifold $\bar{M}$. We denote by $T M^{\perp}$ the normal bundle to $M$ and by g both metric on $M$ and $\bar{M}$. Also, we denote by $\bar{\nabla}$ the Levi-Civita connection on $\bar{M}$, denote by $\nabla$ the induced connection on $M$, and denote by $\nabla^{\perp}$ the induced normal connection on $M$.

Then, for any $X, Y \in \Gamma(T M)$ we have

$$
\begin{equation*}
\bar{\nabla}_{X} Y=\nabla_{X} Y+h(X, Y) \tag{1.5}
\end{equation*}
$$

where $h: \Gamma(T M) \times \Gamma(T M) \rightarrow \Gamma\left(T M^{\perp}\right)$ is a normal bundle valued symmetric bilinear form on $\Gamma(T M)$. The equation (1.5) is called the Gauss formula and $h$ is called the second fundamental form of $M$.

Now, for any $X \in \Gamma(T M)$ and $V \in \Gamma\left(T M^{\perp}\right)$ we denote by $-A_{V} X$ and $\nabla \frac{1}{X} V$ the tangent part and normal part of $\bar{\nabla}_{X} V$ respectively. Then we have

$$
\begin{equation*}
\bar{\nabla}_{X} V=-A_{V} X+\nabla_{X}^{\perp} V \tag{1.6}
\end{equation*}
$$

Thus, for any $V \in \Gamma\left(T M^{\perp}\right)$ we have a linear operator, satisfying

$$
\begin{equation*}
g\left(A_{V} X, Y\right)=g\left(X, A_{V} Y\right)=g(h(X, Y), V) . \tag{1.7}
\end{equation*}
$$

The equation (1.6) is called the Weingarten formula.
An $m$-dimensional distribution on a manifold $\bar{M}$ is a mapping $D$ defined on $\bar{M}$, which assigns to each point $x$ of $\bar{M}$ an $m$-dimensional linear subspace $D_{x}$ of $T_{x} \bar{M}$. A vector field $X$ on $\bar{M}$ belongs to $D$ if we have $X_{x} \in D_{x}$ for each $x \in \bar{M}$. When this happens we write $X \in \Gamma(D)$. The distribution $D$ is said to be differentiable if for any $x \in \bar{M}$ there exist $m$ differentiable linearly independent vector fields $X_{i} \in \Gamma(D)$ in a neighbourhood of $x$. From now on, all distributions are supposed to be differentiable of class $C^{\infty}$.

The distribution $D$ is said to be involutive if for all vector fields $X, Y \in \Gamma(D)$ we have $[X, Y] \in \Gamma(D)$. A sub-manifold $M$ of $\bar{M}$ is said to be an integral manifold of $D$ if for every point $x \in M, D_{x}$ coincides with the tangent space to $M$ at $x$. If there exists no integral manifold of $D$ which contains $M$, then $M$ is called a maximal integral manifold or a leaf of $D$. The distribution $D$ is said to be integrable if for every $x \in \bar{M}$ there exists an integral manifold of $D$ containing $x$.

Definition 1.3 ([1]). Let $\bar{M}$ be a real $n$-dimensional almost Hermitian manifold with almost complex structure $J$ and with Hermitian metric $g$. Let $M$ be a real $m$-dimensional Riemannian manifold isometrically immersed in $\bar{M}$. Then $M$ is called a CR-submanifold of $\bar{M}$ if there exist a differentiable distribution $D: x \rightarrow D_{x} \subset T_{x} M$, on $M$ satisfying the following conditions:
(1) $D$ is holomorphic, that is, $J\left(D_{x}\right)=D_{x}$, for each $x \in M$,
(2) the complementary orthogonal distribution $D^{\perp}: x \rightarrow D_{x}^{\perp} \subset T_{x} M$, is anti-invariant, that is, $J\left(D_{x}^{\perp}\right) \subset T_{x} M^{\perp}$, for each $x \in M$.

Now let $M$ be an arbitrary Riemannian manifold isometrically immersed in an almost Hermitian manifold $\bar{M}$. For each vector field $X$ tangent to $M$, we put

$$
\begin{equation*}
J X=\phi X+\omega X \tag{1.8}
\end{equation*}
$$

where $\phi X$ and $\omega X$ are respectively the tangent part and the normal part of $J X$. Also, for each vector field $V$ normal to $M$, we put

$$
\begin{equation*}
J V=B V+C V, \tag{1.9}
\end{equation*}
$$

where $B V$ and $C V$ are respectively the tangent part and the normal part of $J V$.

Denote by $P$ and $Q$ the project morphisms of $T M$ to $D$ and $D^{\perp}$, then we have

$$
\begin{equation*}
\phi X=J P X \tag{1.10}
\end{equation*}
$$

and

$$
\begin{equation*}
\omega X=J Q X \tag{1.11}
\end{equation*}
$$

for any $X \in \Gamma(T M)$.
The covariant derivative of $\phi$ is defined by

$$
\begin{equation*}
\left(\nabla_{X} \phi\right) Y=\nabla_{X} \phi Y-\phi \nabla_{X} Y, \tag{1.12}
\end{equation*}
$$

for any $X, Y \in \Gamma(T M)$. On the other hand the covariant derivative of $\omega$ is defined by

$$
\begin{equation*}
\left(\nabla_{X} \omega\right) Y=\nabla_{X}^{\perp} \omega Y-\omega \nabla_{X} Y \tag{1.13}
\end{equation*}
$$

for any $X, Y \in \Gamma(T M)$.

## 2. Main Results

Lemma 2.1 (Frobenius $[1,3]$ ). Distribution $D$ on manifold $M$ is integrable if and only if $[X, Y] \in \Gamma(D)$, for all vector fields $X, Y \in \Gamma(D)$.
Lemma 2.2. Let $M$ be a CR-sub-manifold of a quasi-Kaehlerian manifold $\bar{M}$. Then we have

$$
\begin{align*}
\left(\nabla_{X} \omega\right) Y= & -h(X, \phi Y)+C h(X, Y)+h(\phi X, Y)+C h(\phi X, \phi Y)  \tag{2.1}\\
& +\omega \nabla_{\phi X} \phi Y-\omega A_{\omega Y} \phi X+C \nabla_{\phi X}^{\perp} \omega Y,
\end{align*}
$$

for any $X \in \Gamma(D)$ and $Y \in \Gamma(T M)$.
Proof. For any $X \in \Gamma(D)$ and $Y \in \Gamma(T M)$, from (1.3) we have

$$
\begin{equation*}
0=\bar{\nabla}_{X} J Y-J \bar{\nabla}_{X} Y-\bar{\nabla}_{J X} Y-J \bar{\nabla}_{J X} J Y \tag{2.2}
\end{equation*}
$$

By using (2.2), (1.5), (1.6) and (1.8) we get

$$
\begin{align*}
0= & \nabla_{X} \phi Y+h(X, \phi Y)-A_{\omega Y} X+\nabla_{X}^{\perp} \omega Y-J \nabla_{X} Y-J h(X, Y)  \tag{2.3}\\
& -\nabla_{\phi X} Y-h(\phi X, Y)-h(\phi X, Y)-J \nabla_{\phi X} \phi Y \\
& -J h(\phi X, \phi Y)+J A_{\omega Y} \phi X-J \nabla_{\phi X}^{\perp} \omega Y .
\end{align*}
$$

Taking account of (2.3), (1.8) and (1.9), we obtain

$$
\begin{align*}
0= & h(X, \phi Y)-C h(X, Y)-h(\phi X, Y)-C h(\phi X, \phi Y)+\nabla_{X}^{\perp} \omega Y  \tag{2.4}\\
& -\omega \nabla_{X} Y-\omega \nabla_{\phi X} \phi Y+\omega A_{\omega Y} \phi X-C \nabla_{\phi X}^{\perp} \omega Y+\nabla_{X} \phi Y \\
& -A_{\omega Y} X-\phi \nabla_{X} Y-B h(X, Y)-\nabla_{\phi X} Y-\phi \nabla_{\phi X} \phi Y \\
& -B h(\phi X, \phi Y)+\phi A_{\omega Y} \phi X-B \nabla_{\phi X}^{\perp} \omega Y .
\end{align*}
$$

By comparing to the tangent part and the normal part in (2.4), we get

$$
\begin{align*}
0= & \nabla_{X} \phi Y-A_{\omega Y} X-\phi \nabla_{X} Y-B h(X, Y)-\nabla_{\phi X} Y-\phi \nabla_{\phi X} \phi Y  \tag{2.5}\\
& -B h(\phi X, \phi Y)+\phi A_{\omega Y} \phi X-B \nabla_{\phi X}^{\perp} \omega Y
\end{align*}
$$

and

$$
\begin{align*}
0= & h(X, \phi Y)-C h(X, Y)-h(\phi X, Y)-C h(\phi X, \phi Y)+\nabla_{X}^{\perp} \omega Y  \tag{2.6}\\
& -\omega \nabla_{X} Y-\omega \nabla_{\phi X} \phi Y+\omega A_{\omega Y} \phi X-C \nabla_{\phi X}^{\perp} \omega Y .
\end{align*}
$$

Thus (2.1) follows from (2.6) and (1.13).
Theorem 2.1. Let $M$ be a CR-sub-manifold of a quasi-Kaehlerian manifold $\bar{M}$. Then the distribution $D$ is integrable if and only if

$$
\begin{equation*}
\omega[\phi Y, \phi X]+2 h(X, \phi Y)-2 h(\phi X, Y)=0 \tag{2.7}
\end{equation*}
$$

for any $X, Y \in \Gamma(D)$.
Proof. For any $X, Y \in \Gamma(D)$. From (1.5) and (1.8) we have

$$
\begin{equation*}
\omega[X, Y]=\omega\left(\nabla_{X} Y-\nabla_{Y} X\right)=\nabla_{Y}^{\perp} \omega X-\omega \nabla_{Y} X-\nabla_{X}^{\perp} \omega Y+\omega \nabla_{X} Y \tag{2.8}
\end{equation*}
$$

By using (2.8) and (1.13) we obtain

$$
\begin{equation*}
\omega[X, Y]=\left(\nabla_{Y} \omega\right) X-\left(\nabla_{X} \omega\right) Y . \tag{2.9}
\end{equation*}
$$

Taking account of (2.9) and (2.1) we get

$$
\begin{equation*}
\omega[X, Y]=\omega[\phi Y, \phi X]+2 h(X, \phi Y)-2 h(\phi X, Y) . \tag{2.10}
\end{equation*}
$$

According to Frobenius's Theorem, we know that the distribution $D$ is integrable if and only if $\omega[X, Y]=0$, for any $X, Y \in \Gamma(D)$. Taking into account (2.10), we see that the distribution $D$ is integrable if and only if (2.7) is satisfied.

Lemma 2.3 ([4,5]). Let $\bar{M}$ be a quasi-Karhlerian manifold. Then we have

$$
\begin{equation*}
\left(\bar{\nabla}_{X} J\right) Y-\left(\bar{\nabla}_{Y} J\right) X=\frac{1}{2} J[J, J](X, Y), \tag{2.11}
\end{equation*}
$$

for any $X, Y \in \Gamma(T \bar{M})$.
Lemma 2.4 ( $[6,7]$ ). Let $M$ be a CR-sub-manifold of a quasi-Kaehlerian manifold $\bar{M}$. Then the distribution $D$ is integrable if and only if

$$
\begin{equation*}
h(X, J Y)=h(J X, Y) \tag{2.12}
\end{equation*}
$$

and

$$
\begin{equation*}
[J, J](X, Y) \in \Gamma(D), \tag{2.13}
\end{equation*}
$$

for any $X, Y \in \Gamma(D)$.
Theorem 2.2. Let $M$ be a CR-sub-manifold of a quasi-Kaehlerian manifold $\bar{M}$. Then the distribution $D$ is integrable if and only if

$$
\begin{equation*}
h(X, J Y)=h(J X, Y) \tag{2.14}
\end{equation*}
$$

and

$$
\begin{equation*}
4 g\left(\left(\bar{\nabla}_{U} J\right) Y, J X\right)=g([J, J](X, U), Y)-g([J, J](Y, U), X) \tag{2.15}
\end{equation*}
$$

for any $X, Y \in \Gamma(D), U \in \Gamma\left(D^{\perp}\right)$.
Proof. For any $X, Y \in \Gamma(D), U \in \Gamma\left(D^{\perp}\right)$. From (2.11) and (1.1) we have

$$
\begin{equation*}
\frac{1}{2} g([J, J](X, U), Y)=g\left(\left(\bar{\nabla}_{X} J\right) U-\left(\bar{\nabla}_{U} J\right) X, J Y\right) \tag{2.16}
\end{equation*}
$$

From (2.16), (1.1) and (1.5) we get

$$
\begin{align*}
& \frac{1}{2} g([J, J](X, U), Y)  \tag{2.17}\\
& \quad=-g(J U, h(X, J Y))+g\left(U, \bar{\nabla}_{X} Y\right)-g\left(\left(\bar{\nabla}_{U} J\right) X, J Y\right)
\end{align*}
$$

Exchanging $X$ with $Y$ in (2.17) we obtain

$$
\begin{align*}
& \frac{1}{2} g([J, J](Y, U), X)  \tag{2.18}\\
& \quad=-g(J U, h(Y, J X))+g\left(U, \bar{\nabla}_{Y} X\right)-g\left(\left(\bar{\nabla}_{U} J\right) Y, J X\right)
\end{align*}
$$

On the other hand, by a direct computation we achieve

$$
\begin{equation*}
g\left(\left(\bar{\nabla}_{U} J\right) X, J Y\right)=-g\left(\left(\bar{\nabla}_{U} J\right) Y, J X\right) \tag{2.19}
\end{equation*}
$$

From (2.17) and (2.19) we find
(2.20) $\frac{1}{2} g([J, J](X, U), Y)$

$$
=-g(J U, h(X, J Y))+g\left(U, \bar{\nabla}_{X} Y\right)+g\left(\left(\bar{\nabla}_{U} J\right) Y, J X\right) .
$$

(2.20)-(2.18) follows

$$
\begin{align*}
& \frac{1}{2} g([J, J](X, U), Y)-\frac{1}{2} g([J, J](Y, U), X)  \tag{2.21}\\
& \quad=g(J U, h(Y, J X)-h(X, J Y))+g(U,[X, Y])+2 g\left(\left(\bar{\nabla}_{U} J\right) Y, J X\right)
\end{align*}
$$

(2.21) can be become
(2.22) $g([X, Y], U)=\frac{1}{2} g([J, J](X, U), Y)-\frac{1}{2} g([J, J](Y, U), X)$

$$
+g(J U, h(X, J Y)-h(Y, J X))-2 g\left(\left(\bar{\nabla}_{U} J\right) Y, J X\right)
$$

Suppose $D$ is integrable. Then from Lemma 2.4 and (2.22) we have

$$
h(X, J Y)=h(Y, J X)
$$

and

$$
0=\frac{1}{2} g([J, J](X, U), Y)-\frac{1}{2} g([J, J](Y, U), X)-2 g\left(\left(\bar{\nabla}_{U} J\right) Y, J X\right)
$$

for any $X, Y \in \Gamma(D), U \in \Gamma\left(D^{\perp}\right)$, which is equivalent to (2.15).
Conversely, suppose (2.14) and (2.15) are satisfied. From (2.22), (2.14) and (2.15) we have $[X, Y] \in \Gamma(D)$ for any $X, Y \in \Gamma(D)$. By Frobenius's Theorem, we know that the distribution $D$ is integrable.

Lemma 2.5. Let $M$ be a CR-sub-manifold of an almost Hermitian manifold $\bar{M}$. Then we have

$$
\begin{equation*}
\left(\nabla_{X} \phi\right) Y=A_{\omega Y} X+B h(X, Y)+\left(\left(\bar{\nabla}_{X} J\right) Y\right)^{\top}, \tag{2.23}
\end{equation*}
$$

for any $X, Y \in \Gamma(T M)$.
Proof. For any $X, Y \in \Gamma(T M)$. From (1.5) and (1.8) we have

$$
\begin{equation*}
\left(\bar{\nabla}_{X} J\right) Y=\bar{\nabla}_{X}(\phi Y+\omega Y)-J\left(\nabla_{X} Y+h(X, Y)\right) \tag{2.24}
\end{equation*}
$$

By using (2.24), (1.5), (1.6), (1.8) and (1.9) we get

$$
\begin{align*}
\left(\bar{\nabla}_{X} J\right) Y= & \nabla_{X} \phi Y+h(X, \phi Y)-A_{\omega Y} X+\nabla_{X}^{\perp} \omega Y  \tag{2.25}\\
& -\phi \nabla_{X} Y-\omega \nabla_{X} Y-B h(X, Y)-C h(X, Y) .
\end{align*}
$$

By comparying to the tangent part and the normal part in (2.25), we obtain

$$
\begin{equation*}
\left(\left(\bar{\nabla}_{X} J\right) Y\right)^{\top}=\nabla_{X} \phi Y-A_{\omega Y} X-\phi \nabla_{X} Y-B h(X, Y), \tag{2.26}
\end{equation*}
$$

and

$$
\begin{equation*}
\left(\left(\bar{\nabla}_{X} J\right) Y\right)^{\perp}=h(X, \phi Y)+\nabla_{X}^{\perp} \omega Y-\omega \nabla_{X} Y-C h(X, Y) . \tag{2.27}
\end{equation*}
$$

Taking account of (2.26) and (1.12), (2.23) is satisfied.
Theorem 2.3. Let $M$ be a CR-sub-manifold of an almost Hermitian manifold $\bar{M}$. Then the distribution $D^{\perp}$ is integrable if and only if

$$
\begin{equation*}
A_{\omega U} V-A_{\omega V} U+\left(\left(\bar{\nabla}_{V} J\right) U\right)^{\top}-\left(\left(\bar{\nabla}_{U} J\right) V\right)^{\top}=0 \tag{2.28}
\end{equation*}
$$

for any $U, V \in \Gamma\left(D^{\perp}\right)$.

Proof. For any $U, V \in \Gamma\left(D^{\perp}\right)$. From (1.5) and (1.8) we have

$$
\begin{equation*}
\phi[U, V]=\phi\left(\nabla_{U} V-\nabla_{V} U\right)=-\nabla_{U} \phi V+\phi \nabla_{U} V+\nabla_{V} \phi U-\phi \nabla_{V} U . \tag{2.29}
\end{equation*}
$$

By using (2.29) and (1.12) we obtain

$$
\begin{equation*}
\phi[U, V]=\left(\nabla_{V} \phi\right) U-\left(\nabla_{U} \phi\right) V . \tag{2.30}
\end{equation*}
$$

Taking account of (2.23) and (2.30) we get

$$
\begin{equation*}
\phi[U, V]=A_{\omega U} V+\left(\left(\bar{\nabla}_{V} J\right) U\right)^{\top}-A_{\omega V} U-\left(\left(\bar{\nabla}_{U} J\right) V\right)^{\top} . \tag{2.31}
\end{equation*}
$$

According to Frobenius's Theorem, we know that the distribution $D^{\perp}$ is integrable if and only if $\phi[U, V]=0$, for any $U, V \in \Gamma\left(D^{\perp}\right)$. Taking into account (2.31), we see that the distribution $D^{\perp}$ is integrable if and only if (2.28) is satisfied.
