ABSTRACT. We give evidence for a conjecture of Serre and a conjecture of Bogomolov.

2000 Mathematics Subject Classification: 12E30, 20G15 Keywords and Phrases: Function fields of one variable, PAC fields, Conjecture II of Serre,

Conjecture II of Serre considers a field F of characteristic p with  $cd(Gal(F)) \leq 2$ such that either p = 0 or p > 0 and  $[F : F^p] \leq p$  and predicts that  $H^1(Gal(F), G) = 1$  (i.e. each principal homogeneous G-spaces has an Frational point) for each simply connected semi-simple linear algebraic group G [Ser97, p. 139].

As Serre notes, the hypothesis of the conjecture holds in the case where F is a field of transcendence degree 1 over a perfect field K with  $cd(Gal(K)) \leq 1$ . Indeed, in this case  $cd(Gal(F)) \leq 2$  [Ser97, p. 83, Prop. 11] and  $[F:F^p] \leq p$  if p > 0 (by the theory of p-bases [FrJ08, Lemma 2.7.2]). We prove the conjecture for F in the special case, where K is PAC of characteristic 0 that contains all roots of unity.

One of the main ingredients of the proof is the projectivity of  $\operatorname{Gal}(K(x)_{ab})$ (where x is transcendental over K and  $K(x)_{ab}$  is the maximal Abelian extension of K(x)). We also use the same ingredient to establish an analog to the wellknown open problem of Shafarevich that  $\operatorname{Gal}(\mathbb{Q}_{ab})$  is free. Under the assumption that K is PAC and contains all roots of unity we prove that  $\operatorname{Gal}(K(x)_{ab})$  is not only projective but even free. This proves a stronger version of a conjecture of Bogomolov for a function field of one variable F over a PAC field that contains all roots of unity [Pos05, Conjecture 1.1].

## 1. The Projectivity of $Gal(K(x)_{ab})$

We denote the separable (resp. algebraic) closure of a field K by  $K_s$  (resp.  $\tilde{K}$ ) and its absolute Galois group by Gal(K). The field K is said to be PAC if every absolutely irreducible variety defined over K has a K-rational point. The proof of the projectivity result applies a local-global principle for Brauer groups to reduce the statement to Henselian fields.

For a prime number p and an Abelian group A, we say that A is p'-DIVISIBLE, if for each  $a \in A$  and every positive integer n with  $p \nmid n$  there exists  $b \in A$  such that a = nb. Note that if p = 0, then "p'-divisible" is the same as "divisible".

LEMMA 1.1: Let p be 0 or a prime number, B a torsion free Abelian group, and A is a p'-divisible subgroup of B of finite index. Then B is also p'-divisible.

*Proof:* First suppose p = 0 and let m = (B : A). Then, for each  $b \in B$  and a positive integer n there exists  $a \in A$  such that mb = mna. Since B is torsion free, m = na. Thus, B is divisible.

Now suppose p is a prime number, let  $mp^k = (B : A)$ , with  $p \nmid m$  and  $k \ge 0$ , and consider  $b \in B$ . Then  $mp^k b \in A$ . Hence, for each positive integer n with  $p \nmid n$  there exists  $a \in A$  with  $mp^k b = mna$ . Thus,  $p^k b = na$ . Since  $p \nmid n$ , there exist  $x, y \in \mathbb{Z}$  such that  $xp^k + yn = 1$ . It follows from  $xp^k b = xna$  that b = n(xa + yb), as claimed.

COROLLARY 1.2: Let L/K be an algebraic field extension, v a valuation of L, and p = 0 or p is a prime number. Suppose that  $v(K^{\times})$  is p'-divisible. Then  $v(L^{\times})$  is p'-divisible.

Proof: Let  $x \in L^{\times}$  and n a positive integer with  $p \nmid n$ . Then  $v(K(x)^{\times})$  is a torsion free Abelian group and  $v(K^{\times})$  is a subgroup of index at most [K(x):K]. Since  $v(K^{\times})$  is p'-divisible, Lemma 1.1 gives  $y \in K(x)^{\times}$  such that v(x) = nv(y). It follows that  $v(L^{\times})$  is p'-divisible.

Given a Henselian valued field (M, v) we use v also for its unique extension to  $M_s$ . We use a bar to denote the residue with respect to v of objects associated with M, let  $O_M$  be the valuation ring of M, and let  $\Gamma_M = v(M^{\times})$  be the value group of M.

We write  $\operatorname{cd}_l(K)$  and  $\operatorname{cd}(K)$  for the *l*th cohomological dimension and the cohomological dimension of  $\operatorname{Gal}(K)$  and note that  $\operatorname{cd}(K) \leq 1$  if and only if  $\operatorname{Gal}(K)$  is projective [Ser97, p. 58, Cor. 2].

LEMMA 1.3: Let (M, v) be a Henselian valued field. Suppose  $p = char(M) = char(\overline{M})$ ,  $Gal(\overline{M})$  is projective, and  $\Gamma_M$  is p'-divisible. Then Gal(M) is projective.

Proof: We denote the INERTIA FIELD of M by  $M_u$ . It is determined by its absolute Galois group:  $\operatorname{Gal}(M_u) = \{\sigma \in \operatorname{Gal}(M) \mid v(\sigma x - x) > 0 \text{ for all } x \in M_s \text{ with } v(x) \geq 0\}$ . The map  $\sigma \mapsto \overline{\sigma}$  of  $\operatorname{Gal}(M)$  into  $\operatorname{Gal}(\overline{M})$  such that  $\overline{\sigma}\overline{x} = \overline{\sigma}\overline{x}$  for each  $x \in O_M$  is a well defined epimorphism [Efr06, Thm. 16.1.1] whose kernel is  $\operatorname{Gal}(M_u)$ . It therefore defines an isomorphism

(1) 
$$\operatorname{Gal}(M_u/M) \cong \operatorname{Gal}(\bar{M}).$$

518

CLAIM A:  $\overline{M}_u$  is separably closed. Let  $g \in \overline{M}[X]$  be a monic irreducible separable polynomial of degree  $n \geq 1$ . Then there exists a monic polynomial  $f \in O_{M_u}[X]$  of degree n such that  $\overline{f} = g$ . We observe that f is also irreducible and separable. Moreover, if  $f(X) = \prod_{i=1}^{n} (X - x_i)$  with  $x_1, \ldots, x_n \in M_s$ , then  $g(X) = \prod_{i=1}^{n} (X - \overline{x}_i)$ . Given  $1 \leq i, j \leq n$  there exists  $\sigma \in \operatorname{Gal}(M_u)$  such that  $\sigma x_i = x_j$ . By definition,  $\overline{x}_j = \overline{\sigma x_i} = \overline{\sigma} \overline{x}_i = \overline{x}_i$ . Since g is separable, i = j, so n = 1. We conclude that  $\overline{M}_u$  is separably closed.

CLAIM B: Each *l*-Sylow group of  $\operatorname{Gal}(M_u)$  with  $l \neq p$  is trivial. Indeed, let *L* be the fixed field of an *l*-Sylow group of  $\operatorname{Gal}(M_u)$  in  $M_s$ . If l = 2, then  $\zeta_l = -1 \in L$ . If  $l \neq 2$ , then  $[L(\zeta_l) : L]|l - 1$  and  $[L(\zeta_l) : L]$  is a power of *l*, so  $\zeta_l \in L$ .

Assume that  $\operatorname{Gal}(L) \neq 1$ . By the the theory of finite *l*-groups, *L* has a cyclic extension L' of degree *l*. By the preceding paragraph and Kummer theory, there exists  $a \in L^{\times}$  such that  $L' = L(\sqrt[l]{a})$ . By Corollary 1.2, there exists  $b \in L^{\times}$  such that lv(b) = v(a). Then  $c = \frac{a}{b^l}$  satisfies v(c) = 0. By Claim A,  $\overline{L}$  is separably closed. Therefore,  $\overline{c}$  has an *l*th root in  $\overline{L}$ . By Hensel's lemma, *c* has an *l*th root in *L*. It follows that *a* has an *l*-root in *L*. This contradiction implies that  $L = M_s$ , as claimed.

Having proved Claim B, we consider again a prime number  $l \neq p$  and let  $G_l$  be an *l*-Sylow subgroup of Gal(M). By the Claim,  $G_l \cap \text{Gal}(M_u) = 1$ , hence the map res: Gal $(M) \to \text{Gal}(M_u/M)$  maps  $G_l$  isomorphically onto an *l*-Sylow subgroup of Gal $(M_u/M)$ . By (1),  $G_l$  is isomorphic to an *l*-Sylow subgroup of Gal $(\bar{M})$ . Since the latter group is projective, so is  $G_l$ , i.e.  $\text{cd}_l(G) \leq 1$  [Ser97, p. 58, Cor. 2].

Finally, if  $p \neq 0$ , then  $\operatorname{cd}_p(M) \leq 1$  [Ser97, p. 75, Prop. 3], because then  $\operatorname{char}(M) = p$ . It follows that  $\operatorname{cd}(M) \leq 1$  [Ser97, p. 58, Cor. 2].

LEMMA 1.4: Let F be an extension of a PAC field K of transcendence degree 1 and characteristic p. Suppose  $v(F^{\times})$  is p'-divisible for each valuation v of F/K. Then Gal(F) is projective.

**Proof:** Let  $K_{\text{ins}}$  be the maximal purely inseparable algebraic extension of K and set  $F' = FK_{\text{ins}}$ . Then  $K_{\text{ins}}$  is PAC [FrJ08, Cor. 11.2.5], trans.deg $(F'/K_{\text{ins}}) = 1$ , and  $v((F')^{\times})$  is p'-divisible for every valuation v of F' (by Corollary 1.2). Moreover, Gal(F') = Gal(F). Thus, we may replace Kby  $K_{\text{ins}}$  and F by F', if necessary, to assume that K is perfect.

Let V(F/K) be a system of representatives of the equivalence classes of valuations of F that are trivial on K. For each  $v \in V(F/K)$  we choose a Henselian closure  $F_v$  of F at v. By [Efr01, Thm. 3.4], there is an injection of Brauer groups,

(2) 
$$\operatorname{Br}(F) \to \prod_{v \in V(F/K)} \operatorname{Br}(F_v).$$

For each  $v \in V(F/K)$  we have,  $v(F_v^{\times}) = v(F^{\times})$  is p'-divisible. Also, the residue field  $\bar{F}_v$  is an algebraic extension of K. Since K is PAC, a theorem of Ax says

that  $\operatorname{Gal}(K)$  is projective [FrJ08, Thm. 11.6.2], hence  $\operatorname{Gal}(\overline{F}_v)$  is projective [FrJ08, Prop. 22.4.7]. Finally,  $char(F_v) = char(F_v)$ . Therefore, by Lemma 1.3,  $\operatorname{Gal}(F_v)$  is projective, hence  $\operatorname{Br}(F_v) = 0$  [Ser97, p. 78, Prop. 5]. It follows from the injectivity of (2) that Br(F) = 0.

If  $F_1$  is a finite separable extension of F,  $v_1 \in V(F_1/K)$ , and  $v = v_1|_F$ , then  $v(F^{\times})$  is p'-divisible. Hence, by Corollary 1.2,  $v_1((F_1)^{\times})$  is p'-divisible. It follows from the preceding paragraph that  $Br(F_1) = 0$ . Consequently, by [Ser97, p. 78, Prop. 5],  $cd(Gal(F)) \le 1$ . П

LEMMA 1.5: Let p be either 0 or a prime number and let  $\Gamma$  be an additive subgroup of  $\mathbb{Q}$ . Suppose  $\frac{1}{n} \in \Gamma$  for each positive integer n with  $p \nmid n$ . Then  $\Gamma$ is p'-divisible.

*Proof:* We consider  $\gamma \in \Gamma$ . If p = 0, we write  $\gamma = \frac{a}{b}$ , with  $a \in \mathbb{Z}$  and  $b \in \mathbb{N}$ .

From: We consider  $\gamma \in \Gamma$ . If p = 0, we write  $\gamma = b$ , where  $n \in \Gamma$ . Given  $n \in \mathbb{N}$ , we have  $\frac{\gamma}{n} = a \cdot \frac{1}{nb} \in \Gamma$ . If p > 0, we write  $\gamma = \frac{a}{bp^k}$ , where  $a \in \mathbb{Z}$ ,  $b \in \mathbb{N}$ ,  $k \in \mathbb{Z}$ , and  $p \nmid a, b$ . Let  $n \in \mathbb{N}$ with  $p \nmid n$ . If  $k \le 0$ , then  $\frac{\gamma}{n} = ap^{-k} \cdot \frac{1}{nb} \in \Gamma$ . If k > 0, we may choose  $x, y \in \mathbb{Z}$ such that  $xp^k + ynb = 1$ . Then  $\frac{\gamma}{n} = \frac{a}{nbp^k} = \frac{axp^k + aynb}{nbp^k} = ax \cdot \frac{1}{nb} + by \cdot \frac{a}{bp^k} \in \Gamma$ , as claimed.

**PROPOSITION 1.6:** Let K be a PAC field that contains all roots of unity and let E be an extension of K of transcendence degree 1. Then  $Gal(E_{ab})$  is projective.

*Proof:* First we consider the case where E = K(x), where x is transcendental over K, and set  $F = E_{ab}$ . In the notation of Lemma 1.4 we consider a valuation  $v \in V(F/K)$  normalized in such a way that  $v(E^{\times}) = \mathbb{Z}$ . Then  $v(F^{\times}) \leq \mathbb{Q}$ . On the other hand, let p = char(K) and consider a positive integer n with  $p \nmid n$ . Let  $e \in E$  with v(e) = 1. Then  $e^{1/n} \in F$  (because K contains a root of 1 of order n). Therefore,  $\frac{1}{n} = v(e^{1/n}) \in v(F^{\times})$ . By Lemma 1.5,  $v(F^{\times})$  is p'-divisible. We conclude from Lemma 1.4 that Gal(F) is projective.

In the general case we choose  $x \in E$  transcendental over K. By the preceding paragraph,  $Gal(K(x)_{ab})$  is projective. Since taking purely inseparable extensions of a field does not change its absolute Galois group,  $Gal(K(x)_{ab,ins})$  is projective. Now note that  $\operatorname{Gal}(E_{\mathrm{ab,ins}})$  as a subgroup of  $\operatorname{Gal}(K(x)_{\mathrm{ab,ins}})$  is also projective. Hence,  $Gal(E_{ab})$  is projective. 

Remark 1.7: Proposition 1.6 is false if K does not contain all roots of unity. Indeed, the authors will elsewhere provide an example of a prime number l and a PAC field K of characteristic 0 that contains all roots of unity of order nwith  $l \nmid n$  but not  $\zeta_l$  such that  $\operatorname{Gal}(K(x)_{ab})$  is not projective. 

## 2. Serre and Shafarevich

We refer to a simply connected semi-simple linear algebraic group G as a SIM-PLY CONNECTED GROUP. In this case  $H^1(Gal(K), G)$  will be also denoted by  $H^1(K,G)$ . Since each element of  $H^1(K,G)$  is represented by a principal homogeneous space V of G and V is an absolutely irreducible variety defined over K, V has a K-rational point if K is PAC. Hence, V is equivalent to G [LaT58, Prop. 4]. Thus,  $H^1(K, G) = 1$ .

The proof of Serre's Conjecture II in our case is based on the following consequence of a theorem of Colliot-Thélène, Gille, and Parimala:

PROPOSITION 2.1: Let F be a field and G a simply connected group defined over F. Suppose F is a C<sub>2</sub>-field of characteristic 0,  $cd(F) \leq 2$ , and  $cd(F_{ab}) \leq 1$ . Then  $H^1(F, G) = 1$ .

**Proof:** Let F' be a finite extension of F. Since F is  $C_2$ , [CGP04, Thm. 1.1(vi)] implies that if the exponent e of a central simple algebra A over F' is a power of 2 or a power of 3, then e is equal to the index of A.

Since  $cd(F) \leq 2$  and  $cd(F_{ab}) \leq 1$ , [CGP04, Thm. 1.2(v)] implies that  $H^1(F,G) = 1$ .

Remark 2.2: By Merkuriev-Suslin, the assumption that F is a  $C_2$ -field implies that  $cd(F) \leq 2$  [Ser97, end of page 88]. However, we will be able to prove both properties of F directly in the application we have in mind.

The following result establishes the first condition on F.

LEMMA 2.3: Let F be an extension of transcendence degree 1 over a perfect PAC field K. Suppose either char(K) > 0 and K contains all roots of unity or char(K) = 0. Then cd $(F) \leq 2$  and F is a C<sub>2</sub>-field.

*Proof:* By Ax,  $cd(K) \leq 1$  [FrJ08, Thm. 11.6.2]. Hence, by [Ser97, p. 83, Prop. 11],  $cd(F) \leq 2$ .

A conjecture of Ax from 1968 says that every perfect PAC field K is  $C_1$  [FrJ08, Problem 21.2.5]. The conjecture holds if K contains an algebraically closed field [FrJ08, Lemma 21.3.6(a)]. In particular, if  $p = \operatorname{char}(K) > 0$  and K contains all roots of unity, then  $\tilde{\mathbb{F}}_p \subseteq K$ , so K is  $C_1$ . If  $\operatorname{char}(K) = 0$ , K is  $C_1$ , by [Kol07, Thm. 1]. It follows that in each case, F is  $C_2$  [FrJ08, Prop. 21.2.12].

THEOREM 2.4: Let F be an extension of transcendence degree 1 of a PAC field K of characteristic 0. Suppose K contains all roots of unity. Then F satisfies Serre's conjecture II. That is,  $H^1(F,G) = 1$  for each simply connected group G defined over F.

*Proof:* By Lemma 2.3,  $cd(F) \leq 2$  and F is a  $C_2$ -field. By Proposition 1.6,  $cd(F_{ab}) \leq 1$ . It follows from Proposition 2.1 that  $H^1(F, G) = 1$  for each simply connected group G.

Remark 2.5: All of the ingredients of the proof of Theorem 2.4 except possibly Proposition 2.1 work also when char(K) > 0.

The proof of the freeness of  $\operatorname{Gal}(K(x)_{\mathrm{ab}})$  applies the notion of "quasi-freeness" due to Harbater and Stevenson. To this end recall that a FINITE SPLIT EM-BEDDING PROBLEM  $\mathcal{E}$  for a profinite group G is a pair ( $\varphi: G \to A, \alpha: B \to A$ ), where A, B are finite groups,  $\varphi, \alpha$  are epimorphisms, and  $\alpha$  has a group theoretic section. A SOLUTION of  $\mathcal{E}$  is an epimorphism  $\gamma: G \to B$  such that  $\alpha \circ \gamma = \varphi$ . We say that G is QUASI-FREE if its rank m is infinite and every finite split embedding problem for G has m distinct solutions.

THEOREM 2.6: Let F be a function field of one variable over a PAC field K of cardinality m containing all roots of unity and let x be a variable. Then  $Gal(F_{ab})$  is isomorphic to the free profinite group of rank m.

**Proof:** Since K is PAC, K is AMPLE, that is every absolutely irreducible curve defined over K with a K-rational simple point has infinitely many K-rational points. By [HaS05, Cor. 4.4], Gal(F) is quasi-free of rank m = card(K). Hence, by [Har09, Thm. 2.4],  $Gal(F_{ab})$  is also quasi-free of rank m. Since by Proposition 1.6,  $Gal(F_{ab})$  is projective, it follows from a result of Chatzidakis and Melnikov [FrJ08, Lemma 25.1.8] that  $Gal(F_{ab})$  is free of rank m.

Acknowledgment: The authors thank Jean-Louis Colliot-Thélène for stimulating discussions, in particular for pointing out Proposition 2.1 to them.
