

## OPTIMAL GRIDS FOR ANISOTROPIC PROBLEMS\*

S. ASVADUROV<sup>†</sup>, V. DRUSKIN<sup>‡</sup>, AND S. MOSKOW<sup>§</sup>

**Abstract.** Spectral convergence of optimal grids for anisotropic problems is both numerically observed and explained. For elliptic problems, the gridding algorithm is reduced to a Stieltjes rational approximation on an interval of a line in the complex plane instead of the real axis as in the isotropic case. We show rigorously why this occurs for a semi-infinite and bounded interval. We then extend the gridding algorithm to hyperbolic problems on bounded domains. For the propagative modes, the problem is reduced to a rational approximation on an interval of the negative real semiaxis, similarly to in the isotropic case. For the wave problem we present numerical examples in 2-D anisotropic media.

**Key words.** finite differences, DtN maps, anisotropy, spectral approximation

**AMS subject classifications.** 65M06, 65N06
