

SEMICOARSENING MULTGRID FOR SYSTEMS*

J. E. DENDY, JR.[†]

Abstract. Previously we examined the black box multigrid approach to systems of equations. The approach was a direct extension of the methodology used for scalar equations; that is, interpolation and residual weighting were operator induced, and coarsening employed a Galerkin strategy. The application was to standard coarsening of the unknowns. In this paper we consider a semicoarsening approach and find that there are a few differences in what is generally effective.

Key words. multigrid, parallel computation.
