

# BETA BESSEL DISTRIBUTIONS

ARJUN K. GUPTA AND SARALEES NADARAJAH

*Received 5 December 2005; Revised 4 May 2006; Accepted 7 May 2006*

Three new distributions on the unit interval  $[0, 1]$  are introduced which generalize the standard beta distribution. These distributions involve the Bessel function. Expression is derived for their shapes, particular cases, and the  $n$ th moments. Estimation by the method of maximum likelihood and Bayes estimation are discussed. Finally, an application to consumer price indices is illustrated to show that the proposed distributions are better models to economic data than one based on the standard beta distribution.

## 1. Introduction

Beta distributions are very versatile and a variety of uncertainties can be usefully modeled by them. Many of the finite range distributions encountered in practice can be easily transformed into the standard distribution. In reliability and life testing experiments, many times the data are modeled by finite range distributions, see, for example, [2].

A random variable  $X$  is said to have the standard beta distribution with parameters  $\nu$  and  $\mu$  if its probability density function (pdf) is

$$f(x) = \frac{x^{\nu-1}(1-x)^{\mu-1}}{B(\nu, \mu)} \quad (1.1)$$

for  $0 < x < 1$ ,  $\nu > 0$ , and  $\mu > 0$ , where

$$B(a, b) = \int_0^1 t^{a-1}(1-t)^{b-1} dt \quad (1.2)$$

denotes the beta function. Many generalizations of (1.1) involving algebraic, exponential, and hypergeometric functions have been proposed in the literature. Some of these are (see [6, Chapter 25] and [5] for comprehensive accounts)

## 2 Beta Bessel distributions

(i) the four-parameter generalization given by

$$f(x) = \frac{1}{(d-c)B(a,b)} \left(\frac{x-c}{d-c}\right)^{a-1} \left(1 - \frac{x-c}{d-c}\right)^{b-1} \quad (1.3)$$

for  $c \leq x \leq d$ ,  $a > 0$ , and  $b > 0$  (see [7, Section 3.2] for a reparameterization of this);

(ii) the McDonald and Richards [9, 13] beta distribution given by

$$f(x) = \frac{px^{ap-1}\{1 - (x/q)^p\}^{b-1}}{q^{ap}B(a,b)} \quad (1.4)$$

for  $0 \leq x \leq q$ ,  $a > 0$ ,  $b > 0$ ,  $p > 0$ , and  $q > 0$ ;

(iii) the Libby and Novick [8] beta distribution given by

$$f(x) = \frac{\lambda^a x^{a-1} (1-x)^{b-1}}{B(a,b)\{1 - (1-\lambda)x\}^{a+b}} \quad (1.5)$$

for  $0 \leq x \leq 1$ ,  $a > 0$ ,  $b > 0$ , and  $\lambda > 0$ ;

(iv) the McDonald and Xu [10] beta distribution given by

$$f(x) = \frac{px^{ap-1}\{1 - (1-c)(x/q)^p\}^{b-1}}{q^{ap}B(a,b)\{1 + c(x/q)^p\}^{a+b}} \quad (1.6)$$

for  $0 \leq x^p \leq q^p/(1-c)$ , where  $a > 0$ ,  $b > 0$ ,  $0 \leq c \leq 1$ ,  $p > 0$ , and  $q > 0$ ;

(v) the Gauss hypergeometric distribution given by

$$f(x) = \frac{x^{a-1}(1-x)^{b-1}}{(1+zx)^\gamma} B(a,b) {}_2F_1(\gamma, a; a+b; -z) \quad (1.7)$$

for  $0 < x < 1$ ,  $a > 0$ ,  $b > 0$ , and  $-\infty < \gamma < \infty$  (Armero and Bayarri [1]), where

$${}_2F_1(a, b; c; x) = \sum_{k=0}^{\infty} \frac{(a)_k (b)_k}{(c)_k} \frac{x^k}{k!} \quad (1.8)$$

denotes the Gauss hypergeometric function, where  $(f)_k = f(f + 1) \cdots (f + k - 1)$  denotes the ascending factorial;

(vi) confluent hypergeometric distribution given by

$$f(x) = \frac{x^{a-1}(1-x)^{b-1} \exp(-\gamma x)}{B(a, b) {}_1F_1(a; a+b; -\gamma)} \tag{1.9}$$

for  $0 < x < 1$ ,  $a > 0$ ,  $b > 0$ , and  $-\infty < \gamma < \infty$  (Gordy [3]), where

$${}_1F_1(a; b; x) = \sum_{k=0}^{\infty} \frac{(a)_k}{(b)_k} \frac{x^k}{k!} \tag{1.10}$$

is the confluent hypergeometric function.

In this paper, we introduce the first generalizations of (1.1) involving the Bessel function. We refer to them as the beta Bessel (BB) distributions. We propose three BB distributions in all.

For each of the three BB distributions, we derive various particular cases, an expression for the  $n$ th moment as well as estimation procedures by the method of maximum likelihood and Bayes method (Sections 2 to 4). We also present an application of the proposed models to consumer price indices (Section 5). The calculations involve several special functions, including the modified Bessel function of the first kind defined by

$$I_m(x) = \frac{x^m}{\sqrt{\pi} 2^m \Gamma(m + 1/2)} \int_{-1}^1 (1-t^2)^{m-1/2} \exp(xt) dt, \tag{1.11}$$

the  ${}_2F_2$  hypergeometric function defined by

$${}_2F_2(a, b; c, d; x) = \sum_{k=0}^{\infty} \frac{(a)_k (b)_k}{(c)_k (d)_k} \frac{x^k}{k!}, \tag{1.12}$$

and the  ${}_2F_3$  hypergeometric function defined by

$${}_2F_3(a, b; c, d, e; x) = \sum_{k=0}^{\infty} \frac{(a)_k (b)_k}{(c)_k (d)_k (e)_k} \frac{x^k}{k!}, \tag{1.13}$$

where  $(f)_k = f(f + 1) \cdots (f + k - 1)$  denotes the ascending factorial. The properties of the above special functions can be found in [4, 11, 12].

## 2. BB distribution I

The first generalization of (1.1) is given by the pdf

$$f(x) = Cx^{\alpha-1}(1-x)^{\beta-1}I_{\nu}(cx) \quad (2.1)$$

for  $0 < x < 1$ ,  $\nu > 0$ ,  $\alpha > 0$ ,  $\beta > 0$ , and  $c \geq 0$ , where  $C$  denotes the normalizing constant. Application of [12, equation (2.15.2.1)] shows that one can determine  $C$  as

$$\frac{1}{C} = \frac{c^{\nu}\Gamma(\alpha+\nu)\Gamma(\beta)}{2^{\nu}\Gamma(\alpha+\beta+\nu)\Gamma(\nu+1)} {}_2F_3\left(\frac{\alpha+\nu}{2}, \frac{\alpha+\nu+1}{2}; \nu+1, \frac{\alpha+\nu+\beta}{2}, \frac{\alpha+\nu+\beta+1}{2}; \frac{c^2}{4}\right). \quad (2.2)$$

The standard beta pdf (1.1) arises as the particular case of (2.1) for  $c = 0$  and  $\nu = 0$ . Several other particular cases of (2.1) can be obtained using special properties of  $I_{\nu}(\cdot)$ . Note that

$$\begin{aligned} I_{3/2}(x) &= \sqrt{\frac{2}{\pi}} \frac{x \cosh(x) - \sinh(x)}{x^{3/2}}, \\ I_{5/2}(x) &= \sqrt{\frac{2}{\pi}} \frac{(x^2 + 3) \sinh(x) - 3x \cosh(x)}{x^{5/2}}, \\ I_{7/2}(x) &= \sqrt{\frac{2}{\pi}} \frac{x(x^2 + 15) \cosh(x) - 3(2x^2 + 5) \sinh(x)}{x^{7/2}}, \\ I_{9/2}(x) &= \sqrt{\frac{2}{\pi}} \frac{(x^4 + 45x^2 + 105) \sinh(x) - 5x(2x^2 + 21) \cosh(x)}{x^{9/2}}. \end{aligned} \quad (2.3)$$

More generally, if  $\nu - 1/2 \geq 1$  is an integer, then

$$\begin{aligned} I_{\nu}(x) &= \sqrt{2}\sqrt{x\pi} \exp\left\{\frac{\pi i}{2}\left(\frac{1}{2} - \nu\right)\right\} \\ &\times \left[ \sinh\left(\frac{\pi x}{2}\left(\frac{1}{2} - \nu\right) - x\right) \times \sum_{k=0}^{[(2|\nu|-1)/4]} \frac{(|\nu| + 2k - 1/2)!}{(2k)! (|\nu| - 2k - 1/2)! (2x)^{2k}} \right. \\ &\quad \left. + \cosh\left(\frac{\pi x}{2}\left(\frac{1}{2} - \nu\right) - x\right) \sum_{k=0}^{[(2|\nu|-3)/4]} \frac{(|\nu| + 2k + 1/2)! (2x)^{-2k-1}}{(2k+1)! (|\nu| - 2k - 3/2)!} \right]. \end{aligned} \quad (2.4)$$

Figure 2.1. The empirical and fitted densities for the consumer price indices of the United States and the United Kingdom ( $X$  = consumer price index of the United States and  $Y$  = consumer price index of the United Kingdom).

Thus, several particular forms of (2.1) can be obtained for half-integer values of  $\nu$ . For example, if  $\nu = 3/2$ , then (2.1) reduces to

$$f(x) = C\sqrt{\frac{2}{\pi c^3}}x^{\alpha-5/2}(1-x)^{\beta-1}\{cx \cosh(cx) - \sinh(cx)\}. \quad (2.5)$$

If  $\nu = 5/2$ , then (2.1) reduces to

$$f(x) = C\sqrt{\frac{2}{\pi c^5}}x^{\alpha-7/2}(1-x)^{\beta-1}I_\nu(cx)\{(c^2x^2 + 3) \sinh(cx) - 3cx \cosh(cx)\}. \quad (2.6)$$

The modes of (2.1) are the solutions of

$$\frac{\alpha - 1}{x} - \frac{\beta - 1}{1 - x} + \frac{cI_{\nu-1}(cx)}{I_\nu(cx)} = \frac{\nu}{c}. \quad (2.7)$$

There could be more than one mode (see Figures 2.1 and 2.2). The  $n$ th moment of (2.1) can be written as

$$E(X^n) = C \int_0^1 x^{n+\alpha-1}(1-x)^{\beta-1}I_\nu(cx)dx \quad (2.8)$$

## 6 Beta Bessel distributions

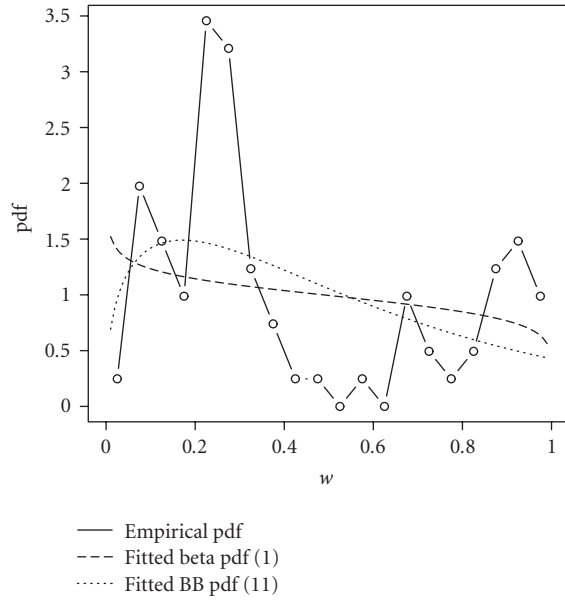

Figure 2.2. The empirical and fitted densities for the consumer price indices of the United States and Germany ( $X$  = consumer price index of the United States and  $Y$  = consumer price index of Germany).

and an application of [12, equation (2.15.2.1)] shows that (2.8) reduces to

$$\begin{aligned}
 E(X^n) &= \frac{C c^\nu \Gamma(n + \alpha + \nu) \Gamma(\beta)}{2^\nu \Gamma(n + \alpha + \beta + \nu) \Gamma(\nu + 1)} \\
 &\times {}_2F_3\left(\frac{n + \alpha + \nu}{2}, \frac{n + \alpha + \nu + 1}{2}; \nu + 1, \frac{n + \alpha + \nu + \beta}{2}, \frac{n + \alpha + \nu + \beta + 1}{2}; \frac{c^2}{4}\right).
 \end{aligned} \tag{2.9}$$

For a random sample  $w_1, \dots, w_n$ , the maximum-likelihood estimators (MLEs) of the four parameters in (2.1) are the solutions of

$$\begin{aligned}
 \sum_{i=1}^n \ln w_i &= -\frac{n}{C} \frac{\partial C}{\partial \alpha}, \\
 \sum_{i=1}^n \ln(1 - w_i) &= -\frac{n}{C} \frac{\partial C}{\partial \beta}, \\
 \sum_{i=1}^n \frac{w_i I_{\nu-1}(c w_i)}{I_\nu(c w_i)} &= \frac{n \nu}{c} - \frac{n}{C} \frac{\partial C}{\partial c}, \\
 \sum_{i=1}^n \frac{\partial I_\nu(c w_i) / \partial \nu}{I_\nu(c w_i)} &= -\frac{n}{C} \frac{\partial C}{\partial \nu}.
 \end{aligned} \tag{2.10}$$

Assuming (2.1) as the prior, the Bayes estimate of the binomial parameter, say  $p$ , is

$$\begin{aligned}
 E(p | x) &= \frac{Cc^\nu \Gamma(x+1+\alpha+\nu)\Gamma(n-x+\beta)}{2^\nu \Gamma(n+1+\alpha+\beta+\nu)\Gamma(\nu+1)} \\
 &\times {}_2F_3\left(\frac{1+x+\alpha+\nu}{2}, \frac{x+\alpha+\nu}{2}+1; \nu+1, \frac{n+1+\alpha+\beta+\nu}{2}, \frac{n+\alpha+\beta+\nu}{2}+1; \frac{c^2}{4}\right),
 \end{aligned}
 \tag{2.11}$$

where  $n$  is the number of trials and  $x$  is the number of successes.

### 3. BB distribution II

The second generalization of (1.1) is given by the pdf

$$f(x) = Cx^{\alpha-1}(1-x)^{\beta-1}\exp(cx)I_\nu(cx) \tag{3.1}$$

for  $0 < x < 1$ ,  $\nu > 0$ ,  $\alpha > 0$ ,  $\beta > 0$ , and  $c \geq 0$ , where  $C$  denotes the normalizing constant. Application of [12, equation (2.15.4.1)] shows that one can determine  $C$  as

$$\frac{1}{C} = \frac{c^\nu \Gamma(\alpha+\nu)\Gamma(\beta)}{2^\nu \Gamma(\alpha+\beta+\nu)\Gamma(\nu+1)} {}_2F_2\left(\nu + \frac{1}{2}, \alpha + \nu; 2\nu + 1, \alpha + \beta + \nu; 2c\right). \tag{3.2}$$

The standard beta pdf (1.1) arises as the particular case of (3.1) for  $c = 0$  and  $\nu = 0$ . Further particular cases of (3.1) can be obtained using (2.4). The modes of (3.1) are the solutions of

$$\frac{\alpha-1}{x} - \frac{\beta-1}{1-x} + \frac{cI_{\nu-1}(cx)}{I_\nu(cx)} = \frac{\nu}{c} - c. \tag{3.3}$$

There could be more than one mode (see Figures 2.1 and 2.2). The  $n$ th moment of (3.1) can be written as

$$E(X^n) = C \int_0^1 x^{n+\alpha-1}(1-x)^{\beta-1}\exp(cx)I_\nu(cx)dx \tag{3.4}$$

and an application of [12, equation (2.15.4.1)] shows that the above reduces to

$$E(X^n) = \frac{Cc^\nu \Gamma(n+\alpha+\nu)\Gamma(\beta)}{2^\nu \Gamma(n+\alpha+\beta+\nu)\Gamma(\nu+1)} {}_2F_2\left(\nu + \frac{1}{2}, n+\alpha+\nu; 2\nu+1, n+\alpha+\beta+\nu; 2c\right). \tag{3.5}$$

## 8 Beta Bessel distributions

For a random sample  $w_1, \dots, w_n$ , the MLEs of the four parameters in (3.1) are the solutions of

$$\begin{aligned} \sum_{i=1}^n \ln w_i &= -\frac{n}{C} \frac{\partial C}{\partial \alpha}, \\ \sum_{i=1}^n \ln(1 - w_i) &= -\frac{n}{C} \frac{\partial C}{\partial \beta}, \\ \sum_{i=1}^n \frac{w_i I_{\nu-1}(cw_i)}{I_{\nu}(cw_i)} + \sum_{i=1}^n w_i &= \frac{n\nu}{c} - \frac{n}{C} \frac{\partial C}{\partial c}, \\ \sum_{i=1}^n \frac{\partial I_{\nu}(cw_i)/\partial \nu}{I_{\nu}(cw_i)} &= -\frac{n}{C} \frac{\partial C}{\partial \nu}. \end{aligned} \tag{3.6}$$

Assuming (3.1) as the prior, the Bayes estimate of the binomial parameter, say  $p$ , is

$$\begin{aligned} E(p | x) &= \frac{C c^{\nu} \Gamma(1+x+\alpha+\nu) \Gamma(n-x+\beta)}{2^{\nu} \Gamma(n+1+\alpha+\beta+\nu) \Gamma(\nu+1)} \\ &\times {}_2F_2\left(\nu + \frac{1}{2}, 1+x+\alpha+\nu; 2\nu+1, n+1+\alpha+\beta+\nu; 2c\right), \end{aligned} \tag{3.7}$$

where  $n$  is the number of trials and  $x$  is the number of successes.

### 4. BB distribution III

The third and final generalization of (1.1) is given by the pdf

$$f(x) = C x^{\alpha-1} (1-x)^{\beta-1} \exp(-cx) I_{\nu}(cx) \tag{4.1}$$

for  $0 < x < 1$ ,  $\nu > 0$ ,  $\alpha > 0$ ,  $\beta > 0$ , and  $c \geq 0$ , where  $C$  denotes the normalizing constant. Application of [12, equation (2.15.4.1)] shows that one can determine  $C$  as

$$\frac{1}{C} = \frac{c^{\nu} \Gamma(\alpha+\nu) \Gamma(\beta)}{2^{\nu} \Gamma(\alpha+\beta+\nu) \Gamma(\nu+1)} {}_2F_2\left(\nu + \frac{1}{2}, \alpha+\nu; 2\nu+1, \alpha+\beta+\nu; -2c\right). \tag{4.2}$$

The standard beta pdf (1.1) arises as the particular case of (4.1) for  $c = 0$  and  $\nu = 0$ . Further particular cases of (4.1) can be obtained using (2.4). The modes of (4.1) are the solutions of

$$\frac{\alpha-1}{x} - \frac{\beta-1}{1-x} + \frac{c I_{\nu-1}(cx)}{I_{\nu}(cx)} = \frac{\nu}{c} + c. \tag{4.3}$$

There could be more than one mode (see Figures 2.1 and 2.2). The  $n$ th moment of (4.1) can be written as

$$E(X^n) = C \int_0^1 x^{n+\alpha-1} (1-x)^{\beta-1} \exp(-cx) I_\nu(cx) dx \quad (4.4)$$

and an application of [12, equation (2.15.4.1)] shows that the above reduces to

$$E(X^n) = \frac{C c^\nu \Gamma(n+\alpha+\nu) \Gamma(\beta)}{2^\nu \Gamma(n+\alpha+\beta+\nu) \Gamma(\nu+1)} {}_2F_2\left(\nu + \frac{1}{2}, n+\alpha+\nu; 2\nu+1, n+\alpha+\beta+\nu; -2c\right). \quad (4.5)$$

For a random sample  $w_1, \dots, w_n$ , the MLEs of the four parameters in (4.1) are the solutions of

$$\begin{aligned} \sum_{i=1}^n \ln w_i &= -\frac{n}{C} \frac{\partial C}{\partial \alpha}, \\ \sum_{i=1}^n \ln(1-w_i) &= -\frac{n}{C} \frac{\partial C}{\partial \beta}, \\ \sum_{i=1}^n \frac{w_i I_{\nu-1}(cw_i)}{I_\nu(cw_i)} - \sum_{i=1}^n w_i &= \frac{n\nu}{c} - \frac{n}{C} \frac{\partial C}{\partial c}, \quad \sum_{i=1}^n \frac{\partial I_\nu(cw_i)/\partial \nu}{I_\nu(cw_i)} = -\frac{n}{C} \frac{\partial C}{\partial \nu}. \end{aligned} \quad (4.6)$$

Assuming (4.1) as the prior, the Bayes estimate of the binomial parameter, say  $p$ , is

$$\begin{aligned} E(p | x) &= \frac{C c^\nu \Gamma(1+x+\alpha+\nu) \Gamma(n-x+\beta)}{2^\nu \Gamma(n+1+\alpha+\beta+\nu) \Gamma(\nu+1)} \\ &\quad \times {}_2F_2\left(\nu + \frac{1}{2}, 1+x+\alpha+\nu; 2\nu+1, n+1+\alpha+\beta+\nu; -2c\right), \end{aligned} \quad (4.7)$$

where  $n$  is the number of trials and  $x$  is the number of successes.

## 5. Application

We now illustrate an application of the proposed beta distributions to consumer price index data. We collected the data on this index for the six countries: United States, United Kingdom, Japan, Canada, Germany, and Australia. The data were extracted from the website <http://www.globalfindata.com/> (go to ‘‘Sample Data’’ under ‘‘Database’’ and then look under ‘‘Consumer Price Indices’’ for the closing value of the index) and the range of data for each country is shown in Table 5.1.

Taking the ratio  $W = X/(X+Y)$ , we attempted to model the relative economic performance of each country against another over the range of overlapping years. This yields 15 data sets for the variable  $W$ . As expected, some of the data for  $W$  appeared to concentrate to a subinterval of  $[0, 1]$  and so suitable location-scale transformations were applied to make the data span from 0 to 1. For each data set, we fitted the standard beta distribution given by (1.1) and the BB III distribution given by (4.1) with  $\nu$  fixed as  $\nu = 1$ . The

Table 5.1. Countries and years of data.

Country	Range of data
Australia	1901 to 2003
Canada	1910 to 2003
Germany	1923 to 2003
Japan	1868 to 2003
United Kingdom	1800 to 2003
United States	1820 to 2003

two distributions were fitted by the method of maximum likelihood. The MLEs of the two parameters in (1.1) are obtained by solving the equations

$$\begin{aligned} \sum_{i=1}^n \ln w_i &= n\Psi(\alpha) - n\Psi(\alpha + \beta), \\ \sum_{i=1}^n \ln(1 - w_i) &= n\Psi(\beta) - n\Psi(\alpha + \beta), \end{aligned} \quad (5.1)$$

where  $\Psi(x) = d \ln \Gamma(x) / dx$  is the digamma function. The MLEs of  $(\alpha, \beta, c)$  in (4.1) with  $\nu$  fixed as  $\nu = 1$  are obtained by solving (4.6).

The results of the fits were remarkable. In each fit, the maximized log-likelihood for (4.1) turned up significantly higher than that for the standard beta model. Here, we give details for just two of the 15 data sets.

- (i) For the (United States, United Kingdom) data set shown in Table A.1 of the appendix the fitted estimates were  $\hat{\alpha} = 1.392$ ,  $\hat{\beta} = 1.230$  with  $\log L = 5.145$  for the standard beta model (1.1); and  $\hat{\alpha} = 0.820$ ,  $\hat{\beta} = -3.180$ ,  $\hat{c} = 1.571$  with  $\log L = 7.647$  for the BB III model (4.1). The corresponding fitted densities superimposed with the empirical density are shown in Figure 2.1 (the empirical density computed using the hist command in the R software package).
- (ii) For the (United States, Germany) data set shown in Table A.2 of the appendix the fitted estimates were  $\hat{\alpha} = 0.914$ ,  $\hat{\beta} = 1.130$  with  $\log L = 1.494$  for the standard beta model (1.1); and  $\hat{\alpha} = 1.405$ ,  $\hat{\beta} = 2.370$ ,  $\hat{c} = 7.828 \times 10^{-6}$  with  $\log L = 5.198$  for the BB III model (4.1). The corresponding fitted densities superimposed with the empirical density are shown in Figure 2.2 (the empirical density computed using the hist command in the R software package).

So, we can conclude at least in this situation that the beta Bessel models are better than the one based on the standard beta distribution.

## Appendix

Tables A.1 and A.2 provide the data on consumer price indices for the United States and the United Kingdom (years of overlap: 1820–2003) and for the United States and Germany (years of overlap: 1923–2003).

Table A.1. Consumer price index data for the United States and the United Kingdom for the years 1820–2003.

Year	US CPI	UK CPI	Year	US CPI	UK CPI	Year	US CPI	UK CPI
