**ABSTRACT.** Let  $S$  be a ring with 1,  $C$  the center of  $S$ ,  $G$  a finite automorphism group of  $S$  of order  $n$  invertible in  $S$ , and  $S^G$  the subring of elements of  $S$  fixed under each element in  $G$ . It is shown that the skew group ring  $S * G$  is a  $G'$ -Galois extension of  $(S * G)^{G'}$  that is a projective separable  $C^G$ -algebra where  $G'$  is the inner automorphism group of  $S * G$  induced by  $G$  if and only if  $S$  is a  $G$ -Galois extension of  $S^G$  that is a projective separable  $C^G$ -algebra. Moreover, properties of the separable subalgebras of a  $G$ -Galois  $H$ -separable extension  $S$  of  $S^G$  are given when  $S^G$  is a projective separable  $C^G$ -algebra.

**KEY WORDS AND PHRASES:** Azumaya algebras, Galois extensions,  $H$ -separable extensions, Skew group rings.

**1991 AMS SUBJECT CLASSIFICATION CODES:** 16S30; 16W20.

### 1. INTRODUCTION

DeMeyer [1] and Kanzaki [2] studied central Galois algebras and Galois extensions whose center is a Galois algebra with Galois group induced by and isomorphic with the group of the extension. These two types of Galois extensions were recently generalized to a bigger class of Galois Azumaya extensions [3] where  $S$  is called a  $G$ -Galois Azumaya extension of  $S^G$  if  $S$  is a  $G$ -Galois extension of  $S^G$  that is an Azumaya  $C^G$ -algebra where  $C$  is the center of  $S$  and  $S^G$  is the subring of elements fixed under each element of  $G$ . Sugano [4] investigated a  $G$ -Galois  $H$ -separable extension of  $S^G$ , and recently, Szeto [5] proved that a  $G$ -Galois  $H$ -separable extension  $S$  of  $S^G$  that is a projective separable  $C^G$ -algebra if and only if  $S$  is a  $C^G$ -Azumaya algebra. We call such an  $S$  a GHS-extension. It will be shown that the skew group ring  $S * G$  is a  $G'$ HS-extension if and only if  $S$  is a  $G$ -Galois extension of  $S^G$  that is a projective separable  $C^G$ -algebra, where  $G'$  is the inner automorphism group of  $S * G$  induced by  $G$ . Moreover, properties of some separable subalgebras of a GHS-extension are also given.

### 2. PRELIMINARIES

Throughout,  $S$  is a ring with 1,  $G$  a finite automorphism group of  $S$  of order  $n$  invertible in  $S$ ,  $C$  the center of  $S$ , and  $S^G$  the subring of elements fixed under each element in  $G$ .  $S$  is called a separable extension of a subring  $T$  if there exist  $\{a_i, b_i \text{ in } S / i = 1, 2, \dots, m\}$  for some integer  $m$  such that  $\sum a_i b_i = 1$  and  $\sum s a_i \otimes b_i = \sum a_i \otimes b_i s$  for each  $s$  in  $S$  where  $\otimes$  is over  $T$ . We call  $\{a_i, b_i\}$  a separable system for  $S$ .  $S$  is called an  $H$ -separable extension of  $T$  if  $S \otimes_T S$  is isomorphic with a direct summand of a finite direct sum of  $S$  as a bimodule over  $S$ . It is known that an  $H$ -separable extension is a separable extension and an Azumaya algebra is an  $H$ -separable extension.  $S$  is called a  $G$ -Galois extension of  $S^G$ , if there exist  $\{c_i, d_i / i = 1, 2, \dots, k\}$  in  $S$  for some integer  $k$  such that  $\sum c_i d_i = 1$  and  $\sum c_i g(d_i) = 0$  for each  $g \neq 1$  in  $G$ . We call  $\otimes \{c_i, d_i\}$  a  $G$ -Galois system for  $S$ .

### 3. SKEW GROUP RINGS

In this section, we shall show that  $S * G$  is a G'HS-extension if and only if  $S$  is a G-Galois extension of  $S^G$  that is a projective separable  $C^G$ -algebra, and give some properties of the separable subalgebras of an G'HS-extension skew group ring.

**THEOREM 3.1.** By keeping the notations of section 2,  $S * G$  is a G'HS-extension if and only if  $S$  is a G-Galois extension of  $S^G$  that is a projective separable  $C^G$ -algebra, where  $G'$  is the inner automorphism group of  $S * G$  induced by  $G$ .

**PROOF.** Let  $S$  be a G-Galois extension of  $S^G$  that is a projective separable  $C^G$ -algebra. Noting that  $S$  is a subring of  $S * G$ , we have that  $S * G$  is also a  $G'$ -Galois extension of  $(S * G)^{G'}$  with a same Galois system as  $S$  where  $G'$  is the inner automorphism group of  $S * G$  induced by  $G$  such that the restriction of  $G'$  to  $S$  is  $G$ . Hence  $S * G$  is an H-separable extension of  $(S * G)^{G'}$  ([4], Corollary 3). Moreover, since  $n$  is a unit in  $S$ ,  $S * G$  is a separable extension of  $S$ . But  $S * G$  is a free module over  $S$  and  $S$  is a G-Galois extension of  $S^G$  that is a projective separable  $C^G$ -algebra by hypothesis, so  $S * G$  is a projective separable  $C^G$ -algebra by the transitivity of projective separable extensions. Since the order of  $G'$  is  $n$ , it is easy to see that  $(S * G)^{G'}$  is a direct summand of  $S * G$  as a two sided  $(S * G)^{G'}$ -module. Noting that  $S * G$  is finitely generated and projective module as a right  $(S * G)^{G'}$ -module or a left module, we have that  $(S * G)^{G'}$  is a projective separable  $C^G$ -algebra by the same argument as given in the proof of Lemma 2 in [1]. This completes the sufficiency.

For the necessity,  $S * G$  is a projective separable  $C^G$ -algebra by the transitivity of projective separable extensions because  $S * G$  is a  $G'$ -Galois extension of  $(S * G)^{G'}$  that is a projective separable algebra of  $C^G$ . Hence  $S * G$  is an Azumaya algebra of its center  $Z$ . But  $S$  is a free module over  $S$  and  $n$  is a unit in  $S$ , so  $S$  is a finitely generated and projective left  $S * G$ -module by the proof of Proposition 2.3 in [6] where  $gs = g(s)$  for each  $s$  in  $S$  and  $g$  in  $G$ . Thus  $S$  is a finitely generated and projective  $Z$ -module by the transitivity of finitely generated and projective modules. Noting that  $1$  is in  $C^G$  and that  $C^G$  is contained in  $Z$ , we have that  $S$  is a faithful  $Z$ -module. Thus  $S$  is a progenerator over  $Z$ . Since  $S * G$  is an Azumaya  $Z$ -algebra,  $S$  is a progenerator over  $S * G$ . Therefore,  $S$  is a G-Galois extension of  $S^G$ . Moreover, since  $S$  is a direct summand of  $S * G$  as a  $C^G$ -module and  $S * G$  is a finitely generated and projective  $C^G$ -module,  $S$  is also a finitely generated and projective  $C^G$ -module. Now  $n$  is a unit in  $S$ , so  $S^G$  is a  $S^G$ -direct summand of  $S$ . This implies that  $S^G$  is a finitely generated and projective  $C^G$ -module. So, it suffices to show that  $S^G$  is a separable  $C^G$ -algebra. In fact, since  $S$  is a progenerator over  $C^G$  (for  $1$  is in  $C^G$ ),  $\text{Hom}_{C^G}(S, S)$  is an Azumaya  $C^G$ -algebra. But  $S^G \approx \text{Hom}_{S * G}(S, S) =$  the commutator of  $S * G$  in  $\text{Hom}_{C^G}(S, S)$ , so  $S^G$  is a separable  $C^G$ -algebra (for so is  $S * G$ ) by the commutant theorem for Azumaya algebras ([6], Theorem 4.3).

Next we give some properties of the separable subalgebras of  $S * G$ .

**COROLLARY 3.2.** If  $S * G$  is a G'HS-extension, then, for any subgroup  $K$  of  $G$ ,  $S * K$  is a  $K'$ -Galois extension of  $(S * K)^{K'}$  that is a separable  $C^G$ -algebra where  $K'$  is the inner automorphism group of  $S * K$  induced by  $K$ .

**PROOF.** By Theorem 3.1,  $S$  is a G-Galois extension of  $S^G$  that is a projective  $C^G$ -algebra, so  $S$  is a  $K$ -Galois extension of  $S^K$ . Hence  $S * K$  is a  $K'$ -Galois of  $(S * K)^{K'}$ . Noting that the order of  $K'$  is a unit in  $S$ , we have that  $(S * K)^{K'}$  is a direct summand of  $S * K$  as a  $(S * K)^{K'}$ -module. But  $S * K$  is a projective separable  $C^G$ -algebra, so  $(S * K)^{K'}$  is a separable  $C^G$ -algebra by the same argument as given in the proof of Lemma 2 in [1].

Let  $V_S(T)$  be the commutator subring of the subring  $T$  in  $S$ , and  $Z$  the center of  $S * G$ . We give an expression of the commutator subring of  $(S * G)^{K'}$  in  $S * G$ .

**THEOREM 3.3.** If  $S^*G$  is a GHS-extension, then (1) for any subgroup  $K$  of  $G$ ,  $V_{S^*G}((S^*G)^K)$  is  $ZK$ , and (2)  $ZK$  is an Azumaya algebra over its center  $D$  such that  $D = D^{K'}$ .

**PROOF.** (1) By Theorem 3.1,  $S^*G$  is a separable  $C^G$ -algebra, so  $S^*G$  is an Azumaya  $Z$ -algebra. Since  $n$  is a unit in  $S$ , the order of  $K$  is a unit in  $S$ ; and so  $ZK$  is a separable  $Z$ -algebra contained in  $S^*G$ . Noting that  $V_{S^*G}(ZK) = (S^*G)^{K'}$ , we have that  $(S^*G)^{K'}$  is a separable  $Z$ -subalgebra of  $S^*G$  such that  $ZK = V_{S^*G}((S^*G)^{K'})$  by the commutant theorem for Azumaya algebras ([6], Theorem 4.3).

(2) Since  $S^*G$  is a separable  $C^G$ -algebra,  $Z$  is a separable  $C^G$ -algebra. Hence  $ZK$  is a separable  $C^G$ -algebra (for the order of  $K$  is a unit in  $Z$ ). Thus  $ZK$  is an Azumaya  $D$ -algebra. It remains to show that  $D = D^{K'}$ . Clearly,  $D^{K'} \subset D$ . Conversely, let  $d$  be an element in  $D$ . Then  $gd = dg$  for each  $g$  in  $K$ , so  $gdg^{-1} = d$  for each  $g$  in  $K$ . Hence  $d$  is in  $D^{K'}$ .

The following consequences are immediate.

**COROLLARY 3.4.** Let  $S^*G$  be an GHS-extension. If  $K$  is an abelian subgroup of  $G$ , then  $(S^*G)^{K'}$  is an Azumaya  $ZK$ -algebra.

**PROOF.** By the proof of Corollary 3.3,  $(S^*G)^{K'}$  and  $ZK$  are separable subalgebras of the Azumaya  $Z$ -algebra  $S^*G$  such that  $V_{S^*G}(ZK) = (S^*G)^{K'}$  and  $V_{S^*G}((S^*G)^{K'}) = ZK$ , so  $ZK$  is contained in the center of  $(S^*G)^{K'}$  and the center of  $(S^*G)^{K'}$  is contained in  $ZK$ . Thus  $ZK$  is the center of  $(S^*G)^{K'}$ .

**COROLLARY 3.5.** Let  $S^*G$  be a GHS-extension. Then (1) if  $(S^*G)^{K'}$  is a commutative ring, then  $ZK$  is an Azumaya  $(S^*G)^{K'}$ -algebra, and (2) if  $(S^*G)^{K'}$  and  $ZK$  are commutative, then  $ZK$  is a splitting ring for the Azumaya  $Z$ -algebra  $S^*G$ .

**PROOF.** (1) It is immediate by the same argument of Corollary 3.4-(1). (2) Since  $(S^*G)^{K'}$  and  $ZK$  are separable subalgebras of the Azumaya  $Z$ -algebra  $S^*G$  such that  $V_{S^*G}((S^*G)^{K'}) = ZK$  and  $V_{S^*G}(ZK) = (S^*G)^{K'}$ ,  $(S^*G)^{K'}$  and  $ZK$  are commutative such that  $V_{S^*G}(ZK) = ZK$ . Hence  $ZK$  is a maximal commutative separable subalgebra of  $S^*G$ . Thus  $ZK$  is a splitting ring for the Azumaya algebra  $S^*G$  ([6], Theorem 5.5).

#### 4. SEPARABLE ALGEBRAS

In this section, we shall give a property of a separable subalgebra of any GHS-extension similar to Theorem 3.3. Let  $T$  be a subalgebra of  $S$  over  $C^G$ . The commutator subring of  $T$  in  $S$  is denoted by  $T'$ .

**THEOREM 4.1.** Let  $S$  be a GHS-extension and  $T$  a separable  $C^G$ -subalgebra of  $S$ , and  $K = \{g \text{ in } G / g(t) = t \text{ for each } t \text{ in } T\}$ . Then  $T'$  is invariant under  $K$  and an Azumaya  $D^{K''}$ -algebra, where  $D$  is the center of  $T'$  and  $K''$  is the restriction of  $K$  to  $T'$ .

**PROOF.** Since  $tt' = t't$  for each  $t$  in  $T$  and  $t'$  in  $T'$ ,  $tg(t) = g(t)t$  for each  $g$  in  $K$ . Hence  $T'$  is invariant under  $K$ .

Next, since  $S$  is a GHS-extension,  $V_S(V_S(S^G)) = S^G$  ([4], Proposition 4-1). Hence  $C = V_S(S) \subset V_S(V_S(S^G)) = S^G$ . This implies  $C = C^G$ . Noting that  $S$  is a separable  $C^G$ -algebra (for  $S$  is a GHS-extension), we have that  $S$  is an Azumaya  $C^G$ -algebra. But  $T$  is a separable subalgebra of  $S$ , so  $T'$  is also a separable subalgebra of  $S$  such that  $V_S(T') = T'$  by the commutant theorem for Azumaya algebras ([6], Theorem 4.3). Let  $D$  be the center of  $T'$ . Then  $D \subset V_S(T') = T' \subset S^G$ . Thus  $D = D^{K''}$  where  $K''$  is the restriction of  $K$  to  $T'$ . The proof is complete.

**COROLLARY 4.2.** Let  $S$  be a GHS-extension,  $T$  a separable  $C^G$ -algebra of  $S$ , and  $N = \{g \text{ in } G / g(t') = t' \text{ for each } t' \text{ in } V_S(T)\}$ . Then  $T'$  is invariant under  $N$  and an Azumaya  $E^{N''}$ -algebra, where  $E$  is the center of  $T'$  and  $N''$  is the restriction of  $N$  to  $T'$ .

**PROOF.** By the proof of Theorem 4.1,  $T$  and  $T'$  ( $= V_S(T)$ ) are separable subalgebras of the Azumaya  $C^G$ -algebra  $S$  such that  $T = V_S(T')$ , so the corollary is immediate by Theorem 4.1.

By Theorem 3.1 in [5], Corollary 4.2 implies the following consequence.

**COROLLARY 4.3.** By keeping the notations and hypotheses of Corollary 4.2,  $T$  is a  $N''$ HS-extension.

We conclude the paper with two examples: (1)  $S$  is a  $G$ -Galois extension of  $S^G$  that is a projective separable  $C^G$ -algebra, but not an  $H$ -separable extension of  $S^G$ , and (2)  $S$  is a GHS-extension.

Example 1. Let  $Q$  be the rational field,  $Q[\sqrt{2}]$  the  $G$ -Galois extension of  $Q$  with Galois group  $G = \{1, g\}$  where  $g(\sqrt{2}) = -\sqrt{2}$  and  $S = M_2(Q[\sqrt{2}])$ , the matrix ring of order 2 over  $Q[\sqrt{2}]$ .

Let  $G' = \{1, g'\}$  where  $g'([a_{ij}]) = [g(a_{ij})]$  for all  $[a_{ij}]$  in  $S$ . Then

- (1)  $S$  is a  $G'$ -Galois extension of  $S^{G'}$ ,
- (2)  $S^{G'} = M_2(Q)$ , the matrix ring of order 2 over  $Q$ ,
- (3)  $S^{G'}$  is a projective separable  $Q$ -algebra,
- (4) the center  $C$  of  $S$  is  $Q[\sqrt{2}]$  and  $C^G = Q$ , and
- (5)  $S$  is not an  $H$ -separable extension of  $S^{G'}$  because  $C \neq C^G$ .

Example 2. Let  $S$  and  $G'$  be given by Example 1. Then  $S$  is a  $G'$ -Galois extension of  $S^{G'}$  that is a projective separable  $C^G$ -algebra by properties (1) through (4) in Example 1. Then the skew group ring  $S * G'$  is a G'HS-extension by Theorem 3.1.

**ACKNOWLEDGMENT.** This work was done under the support of a Caterpillar Fellowship at Bradley University. The paper is revised under the suggestions of the referee. The author would like to thank him for his valuable suggestions.
