

## VECTOR PARAMETERS IN CLASSICAL HYPERBOLIC GEOMETRY

DANAIL BREZOV, CLEMENTINA MLADENOVA AND IVAÏLO MLADENOV

Presented by Ivaïlo M. Mladenov

**Abstract.** Here we use an extension of *Rodrigues' vector parameter* construction for pseudo-rotations in order to obtain explicit formulae for the generalized *Euler* decomposition with arbitrary axes for the structure groups in the classical models of hyperbolic geometry. Although the construction is projected from the universal cover  $SU(1, 1) \simeq SL(2, \mathbb{R})$ , most attention is paid to the  $2 + 1$  *Minkowski* space model, following the close analogy with the *Euclidean* case, and various decompositions of the restricted *Lorentz* group  $SO^+(2, 1)$  are investigated in detail. At the end we propose some possible applications in *special relativity* and *scattering theory*.
