1. Introduction

Let U denote the open unit disc and S_H denote the class of functions which are complex-valued, harmonic, univalent, sense-preserving in U normalized by $f(0) = f_z(0) - 1 = 0$. Each $f \in S_H$ can be expressed as $f = h + \bar{g}$, where h and g are analytic in U . We call h the analytic part and g the co-analytic part of f . A necessary and sufficient condition for f to be locally univalent and sense-preserving in U is that $|h'(z)| > |g'(z)|$ in U (see [3]). Thus for $f = h + \bar{g} \in S_H$, we may write

$$(1.1) \quad h(z) = z + \sum_{k=2}^{\infty} a_k z^k, \quad g(z) = \sum_{k=1}^{\infty} b_k z^k \quad (0 \leq b_1 < 1).$$

Note that S_H reduces to S , the class of normalized analytic univalent functions if the co-analytic part of $f = h + \bar{g}$ is identically zero.

For $\alpha_j \in C$ ($j = 1, 2, \dots, q$) and $\beta_j \in C - \{0, -1, -2, \dots\}$ ($j = 1, 2, \dots, s$), the generalized hypergeometric function is defined by

$${}_qF_s(\alpha_1, \dots, \alpha_q; \beta_1, \dots, \beta_s; z) = \sum_{k=0}^{\infty} \frac{(\alpha_1)_k \cdots (\alpha_q)_k}{(\beta_1)_k \cdots (\beta_s)_k} \frac{z^k}{k!},$$
$$(q \leq s + 1; q, s \in N_0 = \{0, 1, 2, \dots\}),$$

where $(a)_n$ is the Pochhammer symbol defined by

$$(a)_n = \frac{\Gamma(a+n)}{\Gamma(a)} = a(a+1) \cdots (a+n-1)$$

for $n \in \mathbb{N} = \{1, 2, \dots\}$ and 1 when $n = 0$. Corresponding to the function

$$h(\alpha_1, \dots, \alpha_q; \beta_1, \dots, \beta_s; z) = z {}_qF_s(\alpha_1, \dots, \alpha_q; \beta_1, \dots, \beta_s; z).$$

The Dziok-Srivastava operator [4], $H_{q,s}(\alpha_1, \dots, \alpha_q; \beta_1, \dots, \beta_s)$ is defined by

$$\begin{aligned} H_{q,s}(\alpha_1, \dots, \alpha_q; \beta_1, \dots, \beta_s)f(z) &= h(\alpha_1, \dots, \alpha_q; \beta_1, \dots, \beta_s; z) * f(z) \\ &= z + \sum_{k=2}^{\infty} \frac{(\alpha_1)_{k-1} \cdots (\alpha_q)_{k-1}}{(\beta_1)_{k-1} \cdots (\beta_s)_{k-1}} \frac{a_k z^k}{(k-1)!}, \end{aligned}$$

where “*” stands for convolution.

To make the notation simple, we write

$$H_{q,s}[\alpha_1]f(z) = H_{q,s}(\alpha_1, \dots, \alpha_q; \beta_1, \dots, \beta_s)f(z).$$

We define the Dziok-Srivastava operator of the harmonic function $f = h + \bar{g}$ given by (1.1) as

$$(1.2) \quad H_{q,s}[\alpha_1]f = H_{q,s}[\alpha_1]h + \overline{H_{q,s}[\alpha_1]g}.$$

Let $S_H^*(\alpha_1, \beta)$ denote the family of harmonic functions of the form (1.1) such that

$$(1.3) \quad \frac{\partial}{\partial \theta}(\arg H_{q,s}[\alpha_1]f) \geq \beta, \quad 0 \leq \beta < 1, \quad |z| = r < 1.$$

For $q = s + 1$, $\alpha_2 = \beta_1, \dots, \alpha_q = \beta_s$, $S_H^*(1, \beta) = SH(\beta)$ [6] is the class of orientation-preserving harmonic univalent functions f which are starlike of order β in U , that is, $\frac{\partial}{\partial \theta}(\arg f(re^{i\theta})) > \beta$.

Also, $S_H^*(n + 1, \beta) = R_H(n, \beta)$ [7], is the class of harmonic univalent functions with $\frac{\partial}{\partial \theta}(\arg D^n f(z)) \geq \beta$, where D is the Ruscheweyh derivative (see [9]).

We also let $V_{\bar{H}}(\alpha_1, \beta) = S_H^*(\alpha_1, \beta) \cap V_H$, where V_H [5], the class of harmonic functions f of the form (1.1) and there exists ϕ so that, mod 2π ,

$$(1.4) \quad \arg(a_k) + (k-1)\phi = \pi, \quad \arg(b_k) + (k-1)\phi = 0 \quad k \geq 2.$$

Jahangiri and Silverman [5] gave the sufficient and necessary conditions for functions of the form (1.1) to be in $V_H(\beta)$, where $0 \leq \beta < 1$.

Note for $q = s + 1$, $\alpha_1 = 1$, $\alpha_2 = \beta_1, \dots, \alpha_q = \beta_s$ and the co-analytic part of $f = h + \bar{g}$ being zero, the class $V_{\overline{H}}(\alpha_1, \beta)$ reduces to the class studied in [10].

In this paper, we will give a sufficient condition for $f = h + \bar{g}$ given by (1.1) to be in $S_H^*(\alpha_1, \beta)$ and it is shown that this condition is also necessary for functions in $V_{\overline{H}}(\alpha_1, \beta)$. Distortion theorems, extreme points, integral operators and neighborhoods of such functions are considered.

2. Main Results

In our first theorem, we introduce a sufficient coefficient bound for harmonic functions in $S_H^*(\alpha_1, \beta)$.

Theorem 2.1. Let $f = h + \bar{g}$ be given by (1.1). If

$$(2.1) \quad \sum_{k=2}^{\infty} \frac{1}{(k-1)!} \left(\frac{k-\beta}{1-\beta} |a_k| + \frac{k+\beta}{1-\beta} |b_k| \right) \Gamma(\alpha_1, k) \leq 1 - \frac{1+\beta}{1-\beta} |b_1|,$$

where $a_1 = 1$, $0 \leq \beta < 1$ and $\Gamma(\alpha_1, k) = \left| \frac{(\alpha_1)_{k-1} \cdots (\alpha_q)_{k-1}}{(\beta_1)_{k-1} \cdots (\beta_s)_{k-1}} \right|$, then $f \in S_H^*(\alpha_1, \beta)$.

Proof. To prove that $f \in S_H^*(\alpha_1, \beta)$, we only need to show that if (2.1) holds, then the required condition (1.3) is satisfied. For (1.3), we can write

$$\begin{aligned} \frac{\partial}{\partial \theta} (\arg H_{q,s}[\alpha_1] f(z)) &= \operatorname{Re} \left\{ \frac{z(H_{q,s}[\alpha_1] h(z))' - \overline{z(H_{q,s}[\alpha_1] g(z))'}}{H_{q,s}[\alpha_1] h + \overline{H_{q,s}[\alpha_1] g}} \right\} \\ &= \operatorname{Re} \frac{A(z)}{B(z)}. \end{aligned}$$

Using the fact that $\operatorname{Re} \omega \geq \beta$ if and only if $|1 - \beta + \omega| \geq |1 + \beta - \omega|$, it suffices to show that

$$(2.2) \quad |A(z) + (1 - \beta)B(z)| - |A(z) - (1 + \beta)B(z)| \geq 0.$$

Substituting for $A(z)$ and $B(z)$ in (2.1) yields

$$(2.3) \quad |A(z) + (1 - \beta)B(z)| - |A(z) - (1 + \beta)B(z)|$$

[Title Page](#)

[Contents](#)

Page 7 of 17

[Full Screen](#)

[Close](#)

$$\begin{aligned}
 &\geq (2 - \beta)|z| - \sum_{k=2}^{\infty} \frac{k + 1 - \beta}{(k - 1)!} \Gamma(\alpha_1, k) |a_k| |z|^k \\
 &\quad - \sum_{k=1}^{\infty} \frac{k - 1 + \beta}{(k - 1)!} \Gamma(\alpha_1, k) |b_k| |z|^k - \beta|z| \\
 &\quad - \sum_{k=2}^{\infty} \frac{k - 1 - \beta}{(k - 1)!} \Gamma(\alpha_1, k) |a_k| |z|^k - \sum_{k=1}^{\infty} \frac{k + 1 + \beta}{(k - 1)!} \Gamma(\alpha_1, k) |b_k| |z|^k \\
 &\geq 2(1 - \beta)|z| \left\{ 1 - \sum_{k=2}^{\infty} \frac{k - \beta}{(1 - \beta)(k - 1)!} \Gamma(\alpha_1, k) |a_k| \right. \\
 &\quad \left. - \sum_{k=1}^{\infty} \frac{k + \beta}{(1 - \beta)(k - 1)!} \Gamma(\alpha_1, k) |b_k| \right\} \\
 &= 2(1 - \beta)|z| \left\{ 1 - \frac{1 + \beta}{1 - \beta} |b_1| \right. \\
 &\quad \left. - \left[\sum_{k=2}^{\infty} \frac{1}{(k - 1)!} \left(\frac{k - \beta}{1 - \beta} |a_k| + \frac{k + \beta}{1 - \beta} |b_k| \right) \Gamma(\alpha_1, k) \right] \right\}.
 \end{aligned}$$

The last expression is non-negative by (2.1) and so $f \in S_H^*(\alpha_1, \beta)$. □

Now, we obtain the necessary and sufficient conditions for $f = h + \bar{g}$ given by (1.4).

Theorem 2.2. *Let $f = h + \bar{g}$ be given by (1.4). Then $f \in V_{\overline{H}}(\alpha_1, \beta)$ if and only if*

$$(2.4) \quad \sum_{k=2}^{\infty} \frac{1}{(k - 1)!} \left(\frac{k - \beta}{1 - \beta} |a_k| + \frac{k + \beta}{1 - \beta} |b_k| \right) \Gamma(\alpha_1, k) \leq 1 - \frac{1 + \beta}{1 - \beta} |b_1|,$$

where $a_1 = 1$, $0 \leq \beta < 1$ and $\Gamma(\alpha_1, k) = \left| \frac{(\alpha_1)_{k-1} \cdots (\alpha_q)_{k-1}}{(\beta_1)_{k-1} \cdots (\beta_s)_{k-1}} \right|$.

Proof. Since $V_{\overline{H}}(\alpha_1, \beta) \subset S_H^*(\alpha_1, \beta)$, we only need to prove the “only if” part of the theorem. To this end, for functions $f \in V_{\overline{H}}(\alpha_1, \beta)$, we notice that the condition $\frac{\partial}{\partial \theta}(\arg H_{q,s}[\alpha_1]f(z)) \geq \beta$ is equivalent to

$$\frac{\partial}{\partial \theta}(\arg H_{q,s}[\alpha_1]f(z)) - \beta = \operatorname{Re} \left\{ \frac{z(H_{q,s}[\alpha_1]h(z))' - \overline{z(H_{q,s}[\alpha_1]g(z))'}}{H_{q,s}[\alpha_1]h(z) + \overline{H_{q,s}[\alpha_1]g(z)}} - \beta \right\} \geq 0.$$

That is,

$$(2.5) \quad \operatorname{Re} \left[\frac{(1 - \beta)z + \sum_{k=2}^{\infty} \frac{k-\beta}{(k-1)!} \Gamma(\alpha_1, k) |a_k| z^k - \sum_{k=1}^{\infty} \frac{k+\beta}{(k-1)!} \overline{\Gamma(\alpha_1, k)} |b_k| \overline{z}^k}{z + \sum_{k=2}^{\infty} \Gamma(\alpha_1, k) |a_k| z^k + \sum_{k=1}^{\infty} \overline{\Gamma(\alpha_1, k)} |b_k| \overline{z}^k} \right] \geq 0.$$

The above condition must hold for all values of z in U . Upon choosing ϕ according to (1.4), we must have

$$(2.6) \quad \frac{(1 - \beta) - (1 + \beta)|b_1| - \sum_{k=2}^{\infty} \left(\frac{k-\beta}{(k-1)!} |a_k| + \frac{k+\beta}{(k-1)!} |b_k| \right) \Gamma(\alpha_1, k) r^{k-1}}{1 + |b_1| + \sum_{k=2}^{\infty} (|a_k| + |b_k|) \Gamma(\alpha_1, k) r^{k-1}} \geq 0.$$

If condition (2.4) does not hold then the numerator in (2.6) is negative for r sufficiently close to 1. Hence there exist $z_0 = r_0$ in $(0, 1)$ for which the quotient of (2.6) is negative. This contradicts the fact that $f \in V_{\overline{H}}(\alpha_1, \beta)$ and so the proof is complete. \square

The following theorem gives the distortion bounds for functions in $V_{\overline{H}}(\alpha_1, \beta)$ which yields a covering result for this class.

Theorem 2.3. If $f \in V_{\overline{H}}(\alpha_1, \beta)$, then

$$|f(z)| \leq (1 + |b_1|)r + \frac{1}{\Gamma(\alpha_1, 2)} \left(\frac{1 - \beta}{2 - \beta} - \frac{1 + \beta}{2 - \beta} |b_1| \right) r^2 \quad |z| = r < 1$$

and

$$|f(z)| \geq (1 + |b_1|)r - \frac{1}{\Gamma(\alpha_1, 2)} \left(\frac{1 - \beta}{2 - \beta} - \frac{1 + \beta}{2 + \beta} |b_1| \right) r^2 \quad |z| = r < 1.$$

Proof. We will only prove the right hand inequality. The proof for the left hand inequality is similar.

Let $f \in V_{\overline{H}}(\alpha_1, \beta)$. Taking the absolute value of f , we obtain

$$|f(z)| \leq (1 + |b_1|)r + \sum_{k=2}^{\infty} (|a_k| + |b_k|)r^k \leq (1 + |b_1|)r + \sum_{k=2}^{\infty} (|a_k| + |b_k|)r^2.$$

That is,

$$\begin{aligned} |f(z)| &\leq (1 + |b_1|)r + \frac{1 - \beta}{\Gamma(\alpha_1, 2)(2 - \beta)} \sum_{k=2}^{\infty} \left(\frac{2 - \beta}{1 - \beta} |a_k| + \frac{2 - \beta}{1 - \beta} |b_k| \right) \Gamma(\alpha_1, 2)r^2 \\ &\leq (1 + |b_1|)r + \frac{1 - \beta}{\Gamma(\alpha_1, 2)(2 - \beta)} \left[1 - \frac{1 + \beta}{1 - \beta} |b_1| \right] r^2 \\ &\leq (1 + |b_1|)r + \frac{1}{\Gamma(\alpha_1, 2)} \left(\frac{1 - \beta}{2 - \beta} - \frac{1 + \beta}{2 - \beta} |b_1| \right) r^2. \end{aligned}$$

Corollary 2.4. Let f be of the form (1.1) so that $f \in V_{\overline{H}}(\alpha_1, \beta)$. Then

$$(2.7) \quad \left\{ \omega : |\omega| < \frac{2\Gamma(\alpha_1, 2) - 1 - (\Gamma(\alpha_1, 2) - 1)\beta}{(2 - \beta)\Gamma(\alpha_1, 2)} - \frac{2\Gamma(\alpha_1, 2) - 1 - (\Gamma(\alpha_1, 2) - 1)\beta}{(2 + \beta)\Gamma(\alpha_1, 2)} |b_1| \right\} \subset f(U).$$

Next, we examine the extreme points for $V_{\overline{H}}(\alpha_1, \beta)$ and determine extreme points of $V_{\overline{H}}(\alpha_1, \beta)$.

Theorem 2.5. Set

$$\lambda_k = \frac{(1 - \beta)(k - 1)!}{(k - \beta)\Gamma(\alpha_1, k)} \quad \text{and} \quad \mu_k = \frac{(1 - \beta)(k - 1)!}{(k + \beta)\Gamma(\alpha_1, k)}.$$

For b_1 fixed, the extreme points for $V_{\overline{H}}(\alpha_1, \beta)$ are

$$(2.8) \quad \{z + \lambda_k x z^k + \overline{b_1 z}\} \cup \{z + \overline{b_1 z + \mu_k x z^k}\},$$

where $k \geq 2$ and $|x| = 1 - |b_1|$.

Proof. Any function $f \in V_{\overline{H}}(\alpha_1, \beta)$ may be expressed as

$$f(z) = z + \sum_{k=2}^{\infty} |a_k| e^{i\gamma_k} |z^k + \overline{b_1 z} + \sum_{k=2}^{\infty} |b_k| e^{i\delta_k} z^k,$$

where the coefficients satisfy the inequality (2.1). Set

$$h_1(z) = z, g_1(z) = b_1 z, h_k(z) = z + \lambda_k e^{i\gamma_k} z^k \\ g_k = b_1 z + \mu_k e^{i\delta_k} z^k, \quad \text{for } k = 2, 3, \dots$$

Title Page

Writing $X_k = \frac{|a_k|}{\lambda_k}, Y_k = \frac{|b_k|}{\mu_k}, k = 2, 3, \dots$ and

$$X_1 = 1 - \sum_{k=2}^{\infty} X_k; \quad Y_1 = 1 - \sum_{k=2}^{\infty} Y_k,$$

we have

$$f(z) = \sum_{k=1}^{\infty} (X_k h_k(z) + Y_k g_k(z)).$$

In particular, setting

$$f_1(z) = z + \overline{b_1 z} \quad \text{and} \quad f_k(z) = z + \lambda_k x z^k + \overline{b_1 z} + \overline{\mu_k y z^k}$$

$$(k \geq 2, |x| + |y| = 1 - |b_1|),$$

we see that the extreme points of $V_{\overline{H}}(\alpha_1, \beta)$ are contained in $\{f_k(z)\}$.

To see that f_1 is not an extreme point, note that f_1 may be written as

$$f_1(z) = \frac{1}{2} \{f_1(z) + \lambda_2(1 - |b_1|)z^2\} + \frac{1}{2} \{f_1(z) - \lambda_2(1 - |b_1|)z^2\},$$

a convex linear combination of functions in $V_{\overline{H}}(\alpha_1, \beta)$. If both $|x| \neq 0$ and $|y| \neq 0$, we will show that it can also be expressed as a convex linear combination of functions in $V_{\overline{H}}(\alpha_1, \beta)$. Without loss of generality, assume $|x| \geq |y|$. Choose $\epsilon > 0$ small enough so that $\epsilon < \frac{|x|}{|y|}$. Set $A = 1 + \epsilon$ and $B = 1 - \left| \frac{\epsilon x}{y} \right|$. We then see that both

$$t_1(z) = z + \lambda_k A x z^k + \overline{b_1 z + \mu_k y B z^k}$$

and

$$t_2(z) = z + \lambda_k(2 - A)x z^k + \overline{b_1 z + \mu_k y(2 - B)z^k}$$

[Title Page](#)

[Contents](#)

Page 12 of 17

[Go Back](#)

[Full Screen](#)

[Close](#)

are in $V_{\overline{H}}(\alpha_1, \beta)$ and note that

$$f_n(z) = \frac{1}{2}\{t_1(z) + t_2(z)\}.$$

The extremal coefficient bound shows that the functions of the form (2.8) are the extreme points for $V_{\overline{H}}(\alpha_1, \beta)$ and so the proof is complete. \square

For $q = s + 1, \alpha_2 = \beta_1, \dots, \alpha_q = \beta_s, \alpha_1 = n + 1$, Theorems 2.1 to 2.5 give Theorems 1, 2, 3 and 4 in [7].

Now, we will examine the closure properties of the class $V_{\overline{H}}(\alpha_1, \beta)$ under the generalized Bernardi-Libera-Livingston integral operator $L_c(f)$ which is defined by

$$L_c(f(z)) = \frac{c+1}{z^c} \int_0^z t^{c-1} f(t) dt, \quad c > -1.$$

Theorem 2.6. *Let $f \in V_{\overline{H}}(\alpha_1, \beta)$. Then $L_c(f(z))$ belongs to the class $V_{\overline{H}}(\alpha_1, \beta)$.*

Proof. From the representation of $L_c(f(z))$, it follows that

$$\begin{aligned} L_c(f(z)) &= \frac{c+1}{z^c} \int_0^z t^{c-1} \{h(t) + \overline{g(t)}\} dt \\ &= \frac{c+1}{z^c} \left(\int_0^z t^{c-1} \left(t + \sum_{k=2}^{\infty} a_k t^k \right) dt + \overline{\int_0^z t^{c-1} \left(\sum_{k=1}^{\infty} b_k t^k \right) dt} \right) \\ &= z + \sum_{k=2}^{\infty} A_k z^k + \sum_{k=1}^{\infty} \overline{B_k z^k}, \end{aligned}$$

where

$$A_k = \frac{c+1}{c+k} a_k, \quad B_k = \frac{c+1}{c+k} b_k.$$

Title Page

Contents

Page 13 of 17

Therefore,

$$\begin{aligned} & \sum_{k=2}^{\infty} \frac{1}{(k-1)!} \left(\frac{(k-\beta)(c+1)}{(1-\beta)(c+k)} |a_k| + \frac{(k+\beta)(c+1)}{(1-\beta)(c+k)} |b_k| \right) \Gamma(\alpha_1, k) \\ & \leq \sum_{k=2}^{\infty} \frac{1}{(k-1)!} \left(\frac{k-\beta}{1-\beta} |a_k| + \frac{k+\beta}{1-\beta} |b_k| \right) \Gamma(\alpha_1, k) \\ & \leq 1 - \frac{1+\beta}{1-\beta} b_1. \end{aligned}$$

Since $f \in V_{\overline{H}}(\alpha_1, \beta)$, therefore by Theorem 2.2, $L_c(f(z)) \in V_{\overline{H}}(\alpha_1, \beta)$. □

The next theorem gives a sufficient coefficient bound for functions in $S^*(\alpha_1, \beta)$.

Theorem 2.7. $f \in S_H^*(\alpha_1, \beta)$ if and only if

$$\begin{aligned} & H_{q,s}[\alpha_1]h(z) * \left[\frac{2(1-\beta)z + (\xi-1+2\beta)z^2}{(1-z)^2} \right] \\ & + \overline{H_{q,s}[\alpha_1]g} * \left[\frac{2(\xi+\beta)\bar{z} - (\xi-1+2\beta)\bar{z}^2}{(1-\bar{z})^2} \right] \neq 0, \quad |\xi| = 1, \quad z \in U. \end{aligned}$$

Proof. From (1.3), $f \in S_H^*(\alpha_1, \beta)$ if and only if for $z = re^{i\theta}$ in U , we have

$$\frac{\partial}{\partial \theta} (\arg(H_{q,s}[\alpha_1]f(re^{i\theta}))) = \frac{\partial}{\partial \theta} \left[\arg \left(H_{q,s}[\alpha_1]h(re^{i\theta}) + \overline{H_{q,s}[\alpha_1]g(re^{i\theta})} \right) \right] \geq \beta.$$

Therefore, we must have

$$\operatorname{Re} \left\{ \frac{1}{1-\beta} \left[\frac{z(H_{q,s}[\alpha_1]h(z))' - \overline{z(H_{q,s}[\alpha_1]g(z))'}}{H_{q,s}[\alpha_1]h(z) + \overline{H_{q,s}[\alpha_1]g(z)}} - \beta \right] \right\} \geq 0.$$

Title Page

Since

$$\frac{1}{1-\beta} \left[\frac{z(H_{q,s}[\alpha_1]h(z))' - \overline{z(H_{q,s}[\alpha_1]g(z))'}}{H_{q,s}[\alpha_1]h(z) + \overline{H_{q,s}[\alpha_1]g(z)}} - \beta \right] = 1 \quad \text{at } z = 0,$$

the above required condition is equivalent to

$$(2.9) \quad \frac{1}{1-\beta} \left[\frac{z(H_{q,s}[\alpha_1]h(z))' - \overline{z(H_{q,s}[\alpha_1]g(z))'}}{H_{q,s}[\alpha_1]h(z) + \overline{H_{q,s}[\alpha_1]g(z)}} - \beta \right] \neq \frac{\xi - 1}{\xi + 1},$$

$$|\xi| = 1, \quad \xi \neq -1, \quad 0 < |z| < 1.$$

By a simple algebraic manipulation, inequality (2.9) yields

$$\begin{aligned} & 0 \neq (\xi + 1)[z(H_{q,s}[\alpha_1]h(z))' - \overline{z(H_{q,s}[\alpha_1]g(z))'}] \\ & \quad - (\xi - 1 + 2\beta)[H_{q,s}[\alpha_1]h(z) + \overline{H_{q,s}[\alpha_1]g(z)}] \\ & = H_{q,s}[\alpha_1]h(z) * \left[\frac{(\xi + 1)z}{(1-z)^2} - \frac{\xi - 1 + 2\beta}{1-z} \right] \\ & \quad - \overline{H_{q,s}[\alpha_1]g(z)} * \left[\frac{(\bar{\xi} + 1)z}{(1-z)^2} + \frac{(\bar{\xi} - 1 + 2\beta)z}{1-z} \right] \\ & = H_{q,s}[\alpha_1]h(z) * \left[\frac{2(1-\beta)z + (\xi - 1 + 2\beta)z^2}{(1-z)^2} \right] \\ & \quad + \overline{H_{q,s}[\alpha_1]g(z)} * \left[\frac{2(\bar{\xi} + \beta)z - (\bar{\xi} - 1 + 2\beta)z^2}{(1-z)^2} \right], \end{aligned}$$

which is the condition required by Theorem 2.7. □

Finally, for f given by (1.1), the δ -neighborhood of f is the set

$$N_\delta(f) = \left\{ F = z + \sum_{k=2}^{\infty} A_k z^k + \sum_{k=1}^{\infty} \overline{B_k z^k} : \sum_{k=2}^{\infty} k(|a_k - A_k| + |b_k - B_k|) + |b_1 - B_1| \leq \delta \right\}$$

(see [1] [8]). In our case, let us define the generalized δ -neighborhood of f to be the set

$$N(f) = \left\{ F : \sum_{k=2}^{\infty} \frac{\Gamma(\alpha_1, k)}{(k-1)!} [(k-\beta)|a_k - A_k| + (k+\beta)|b_k - B_k|] + (1+\beta)|b_1 - B_1| \leq (1-\beta)\delta \right\}.$$

Theorem 2.8. Let f be given by (1.1). If f satisfies the conditions

$$(2.10) \quad \sum_{k=2}^{\infty} \frac{k(k-\beta)}{(k-1)!} |a_k| \Gamma(\alpha_1, k) + \sum_{k=1}^{\infty} \frac{k(k+\beta)}{(k-1)!} |b_k| \Gamma(\alpha_1, k) \leq 1-\beta, \quad 0 \leq \beta < 1$$

and

$$\delta \leq \frac{1-\beta}{2-\beta} \left(1 - \frac{1+\beta}{1-\beta} |b_1| \right),$$

then $N(f) \subset S_H^*(\alpha_1, \beta)$.

Proof. Let f satisfy (2.10) and

$$F(z) = z + \overline{B_1 z} + \sum_{k=2}^{\infty} (A_k z^k + \overline{B_k z^k})$$

belong to $N(f)$. We have

$$\begin{aligned} & (1 + \beta)|B_1| + \sum_{k=2}^{\infty} \frac{\Gamma(\alpha_1, k)}{(k-1)!} ((k - \beta)|A_k| + (k + \beta)|B_k|) \\ & \leq (1 + \beta)|B_1 - b_1| + (1 + \beta)|b_1| + \sum_{k=2}^{\infty} \frac{\Gamma(\alpha_1, k)}{(k-1)!} [(k - \beta)|A_k - a_k| + (k + \beta)|B_k - b_k|] \\ & \quad + \sum_{k=2}^{\infty} \frac{\Gamma(\alpha_1, k)}{(k-1)!} [(k - \beta)|a_k| + (k + \beta)|b_k|] \\ & \leq (1 - \beta)\delta + (1 + \beta)|b_1| + \frac{1}{2 - \beta} \sum_{k=2}^{\infty} k \frac{\Gamma(\alpha_1, k)}{(k-1)!} [(k - \beta)|a_k| + (k + \beta)|b_k|] \\ & \leq (1 - \beta)\delta + (1 + \beta)|b_1| + \frac{1}{2 - \beta} [(1 - \beta) - (1 + \beta)|b_1|] \\ & \leq 1 - \beta. \end{aligned}$$

Hence, for

$$\delta \leq \frac{1 - \beta}{2 - \beta} \left[1 - \frac{1 + \beta}{1 - \beta} |b_1| \right],$$

we have $F(z) \in S_H^*(\alpha_1, \beta)$.
