Differential equations of third order, Boundedness.
Sufficient conditions are established for the ultimate boundedness of solutions of certain third-order nonlinear differential equations. Our result improves on Tunc's [C. Tunc, Boundedness of solutions of a third-order nonlinear differential equation, J. Inequal. Pure and Appl. Math., 6(1) Art. 3,2005,1-6].

The author would like to express sincere thanks to the anonymous referees for their invaluable corrections, comments and suggestions.

## 1. Introduction

We consider the third-order nonlinear ordinary differential equation,

$$
\begin{equation*}
\dddot{x}+f(x, \dot{x}, \ddot{x}) \ddot{x}+g(x, \dot{x})+h(x, \dot{x}, \ddot{x})=p(t, x, \dot{x}, \ddot{x}) \tag{1.1}
\end{equation*}
$$

or its equivalent system

$$
\begin{equation*}
\dot{x}=y, \quad \dot{y}=z, \quad \dot{z}=-f(x, y, z) z-g(x, y)-h(x, y, z)+p(t, x, y, z) \tag{1.2}
\end{equation*}
$$

where $f, g, h$ and $p$ are continuous in their respective arguments, and the dots denote differentiation with respect to $t$. The derivatives

$$
\begin{array}{lll}
\frac{\partial f(x, y, z)}{\partial x} \equiv f_{x}(x, y, z), & \frac{\partial f(x, y, z)}{\partial z} \equiv f_{z}(x, y, z), & \frac{\partial h(x, y, z)}{\partial x} \equiv h_{x}(x, y, z), \\
\frac{\partial h(x, y, z)}{\partial y} \equiv h_{y}(x, y, z), & \frac{\partial h(x, y, z)}{\partial z} \equiv h_{z}(x, y, z) \quad \text { and } \quad \frac{\partial g(x, y)}{\partial x} \equiv g_{x}(x, y)
\end{array}
$$

exist and are continuous. Moreover, the existence and the uniqueness of solutions of (1.1) will be assumed. It is well known that the ultimate boundedness is a very important problem in the theory and applications of differential equations, and an effective method for studying the ultimate boundedness of nonlinear differential equations is still the Lyapunov's direct method (see [1] - [8]).

Recently, Tunc [7] discussed the ultimate boundedness results of Eq. (1.1) and the following result was proved.

Theorem A (Tunc [7]). Further to the assumptions on the functions $f, g, h$ and $p$ assume the following conditions are satisfied ( $a, b, c, l, m$ and $A$-some positive constants):

$$
\text { (i) } f(x, y, z) \geq a \text { and } a b-c>0 \text { for all } x, y, z \text {; }
$$

(ii) $\frac{g(x, y)}{y} \geq b$ for all $x, y \neq 0$;
(iii) $\frac{h(x, 0,0)}{x} \geq$ cfor all $x \neq 0$;
(iv) $0<h_{x}(x, y, 0)<c$, for all $x, y$;
(v) $h_{y}(x, y, 0) \geq 0$ for all $x, y$;
(vi) $h_{z}(x, y, 0) \geq m$ for all $x, y$;
(vii) $y f_{x}(x, y, z) \leq 0, y f_{z}(x, y, z) \geq 0$ and $g_{x}(x, y) \leq 0$ for all $x, y, z$;
(viii) $y z h_{y}(x, y, 0)+a y z h_{z}(x, y, z) \geq 0$ for all $x, y, z$;
(ix) $|p(t, x, y, z)| \leq e(t)$ for all $t \geq 0, x, y, z$, where $\int_{0}^{t} e(s) d s \leq A<\infty$.

Then, given any finite numbers $x_{0}, y_{0}, z_{0}$ there is a finite constant $D=D\left(x_{0}, y_{0}, z_{0}\right)$ such that the unique solution $(x(t), y(t), z(t))$ of (1.2) which is determined by the initial conditions

$$
x(0)=x_{0}, \quad y(0)=y_{0}, \quad z(0)=z_{0}
$$

satisfies

$$
|x(t)| \leq D, \quad|y(t)| \leq D, \quad|z(t)| \leq D
$$

Theorem A to these special cases to obtain new or better results since Theorem A has some hypotheses which are not necessary for the stability of many nonlinear equations. The Lyapunov function used in the proof of Theorem A is not complete (see [2]). Furthermore, the boundedness result considered in [7] is of the type in which the bounding constant depends on the solution in question.

Our aim in this paper is to further study the boundedness of solutions of Eq. (1.1). In the next section, we establish a criterion for the ultimate boundedness of solutions of Eq. (1.1), which extends and improves Theorem A.

Our main result is the following theorem.
Theorem 1.1. Further to the basic assumptions on the functions $f, g, h$ and $p$ assume that the following conditions are satisfied ( $a, b, c, \nu$ and $A$ - some positive constants):
(i) $f(x, y, z)>a$ and $a b-c>0$ for all $x, y, z$;
(ii) $\frac{g(x, y)}{y} \geq$ for all $x, y \neq 0$;
(iii) $\frac{h(x, y, z)}{x} \geq \nu$ for all $x \neq 0$;
(iv) $h_{x}(x, 0,0) \leq c, h_{y}(x, y, 0) \geq 0$ and $h_{z}(x, 0, z) \geq 0$ for all $x, y, z$;
(v) $y f_{x}(x, y, z) \leq 0, y f_{z}(x, y, z) \geq 0$ and $g_{x}(x, y) \leq 0$ for all $x, y, z$;
(vi) $|p(t, x, y, z)| \leq A<\infty$ for all $t \geq 0$.

Then every solution $x(t)$ of (1.1) satisfies

$$
\begin{equation*}
|x(t)| \leq D, \quad|\dot{x}(t)| \leq D, \quad|\ddot{x}(t)| \leq D \tag{1.3}
\end{equation*}
$$

for all sufficiently large $t$, where $D$ is a constant depending only on $a, b, c, A$ and $\nu$.

## 2. Preliminaries

It is convenient here to consider, in place of the equation (1.1), the system (1.2). It is to be shown then, in order to prove the theorem, that, under the conditions stated in the theorem, every solution $(x(t), y(t), z(t))$ of (1.2) satisfies

$$
\begin{equation*}
|x(t)| \leq D, \quad|y(t)| \leq D, \quad|z(t)| \leq D \tag{2.1}
\end{equation*}
$$

for all sufficiently large $t$, where $D$ is the constant in (1.3).
Our proof of (2.1) rests entirely on two properties (stated in the lemma below) of the function $V=V(x, y, z)$ defined by

$$
\begin{equation*}
V=V_{1}+V_{2} \tag{2.2}
\end{equation*}
$$

where $V_{1}, V_{2}$ are given by

$$
\begin{align*}
2 V_{1}=2 \int_{0}^{x} h(\xi, 0,0) d \xi+2 \int_{0}^{y} \eta f & (x, \eta, 0) d \eta+2 \delta \int_{0}^{y} g(x, \eta) d \eta  \tag{2.3a}\\
& +\delta z^{2}+2 y z+2 \delta y h(x, 0,0)-\alpha \beta y^{2}
\end{align*}
$$

(2.3b) $2 V_{2}=\alpha \beta b x^{2}+2 a \int_{0}^{x} h(\xi, 0,0) d \xi+2 a \int_{0}^{y} \eta f(x, \eta, 0) d \eta$

$$
+2 \int_{0}^{y} g(x, \eta) d \eta+z^{2}+2 a \alpha \beta x y+2 \alpha \beta x z+2 a y z+2 y h(x, 0,0)
$$

and $\beta$ will be fixed to advantage later.
Lemma 2.1. Subject to the conditions of Theorem 1.1, $V(0,0,0)=0$ and there is a positive constant $D_{1}$ depending only on $a, b, c, \alpha$ and $\delta$ such that

$$
\begin{equation*}
V(x, y, z) \geq D_{1}\left(x^{2}+y^{2}+z^{2}\right) \tag{2.4}
\end{equation*}
$$

for all $x, y, z$. Furthermore, there are finite constants $D_{2}>0, D_{3}>0$ dependent only on $a, b, c, A, \nu, \delta$, and $\alpha$ such that for any solution $(x(t), y(t), z(t))$ of (1.2),

$$
\begin{equation*}
\dot{V} \equiv \frac{d}{d t} V(x(t), y(t), z(t)) \leq-D_{2} \tag{2.5}
\end{equation*}
$$

provided that $x^{2}+y^{2}+z^{2} \geq D_{3}$.
Proof of Lemma 2.1. To verify (2.4) observe first that the expressions (2.3) defining $2 V_{1}, 2 V_{2}$ may be rewritten in the forms

$$
\begin{aligned}
& 2 V_{1}=\left\{2 \int_{0}^{x} h(\xi, 0,0) d \xi-\frac{\delta}{b} h^{2}(x, 0,0)\right\}+\delta b\left\{y+\frac{h(x, 0,0)}{b}\right\}^{2} \\
& +\left\{2 \int_{0}^{y} \eta f(x, \eta, 0) d \eta-\delta^{-1} y^{2}-\alpha \beta y^{2}\right\}+\delta\left(z+\delta^{-1} y\right)^{2} \\
& +
\end{aligned}
$$

$$
+a\left\{2 \int_{0}^{y} \eta f(x, \eta, 0) d \eta-a y^{2}\right\}+(\alpha \beta x+a y+z)^{2}
$$

The term $2 \int_{0}^{x} h(\xi, 0,0) d \xi-\frac{\delta}{b} h^{2}(x, 0,0)$ in the rearrangement for $2 V_{1}$ is evidently equal to

$$
2 \int_{0}^{x}\left\{1-\frac{\delta}{b} h_{\xi}(\xi, 0,0)\right\} h(\xi, 0,0) d \xi-\frac{\delta}{b} h^{2}(0,0,0) .
$$

By conditions (iii) and (iv) of Theorem 1.1 and $h(0,0,0)=0$, we have

$$
2 \int_{0}^{x}\left\{1-\frac{\delta}{b} h_{\xi}(\xi, 0,0)\right\} h(\xi, 0,0) d \xi-\frac{\delta}{b} h^{2}(0,0,0) \geq\left(1-\frac{\delta}{b} c\right) \nu x^{2}
$$

In the same way, using (iii) and (iv), it can be shown that the term

$$
\left\{2 \int_{0}^{x} h(\xi, 0,0) d \xi-\beta^{-1} h^{2}(x, 0,0)\right\}
$$

appearing in the rearrangement for $2 V_{2}$ satisfies

$$
\left\{2 \int_{0}^{x} h(\xi, 0,0) d \xi-\beta^{-1} h^{2}(x, 0,0)\right\} \geq\left(1-\frac{c}{\beta}\right) \nu x^{2}
$$

Page 8 of 15
Go Back
for all $x$.
Since $\frac{h(x, y, z)}{x} \geq \nu \quad(x \neq 0), \quad \frac{g(x, y)}{y} \geq b, \quad(y \neq 0)$ and $f(x, y, z)>a$, and Full Screen

for all $x, y$ and $z$. Hence if we choose $\beta=a b$ the constants $1-\frac{\delta}{b} c, b-\alpha \beta, 1-\frac{c}{\beta}$, $a-\frac{1}{\delta}-\alpha \beta$ and $b-\frac{\beta}{a}$ are either zero or positive. This implies that there exists a constant $D_{1}$ small enough such that (2.4) holds.

To deal with the other half of the lemma, let $(x(t), y(t), z(t))$ be any solution of (1.2) and consider the function

$$
V(t) \equiv V(x(t), y(t), z(t))
$$

By an elementary calculation using (1.2), (2.2) and (2.3), we have that

$$
\begin{align*}
& \dot{V}=(1+\delta) y \int_{0}^{y} g_{x}(x, \eta) d \eta+(1+a) y \int_{0}^{y} \eta f_{x}(x, \eta, 0) d \eta  \tag{2.6}\\
&-(1+a) \frac{\{f(x, y, z)-f(x, y, 0)\}}{z} y z^{2}-(1+a) \frac{\{h(x, y, z)-h(x, 0,0)\}}{y} y^{2} \\
&-(1+\delta) \frac{\{h(x, y, z)-h(x, 0,0)\}}{z} z^{2}-\alpha \beta \frac{h(x, y, z)}{x} x^{2}-\frac{g(x, y)}{y} y^{2} \\
&- a \frac{g(x, y)}{y} y^{2}+\delta h_{x}(x, 0,0) y^{2}+h_{x}(x, 0,0) y^{2}+a \alpha \beta y^{2} \\
&-\delta f(x, y, z) z^{2}-[f(x, y, z)-a] z^{2}+z^{2}-\alpha \beta\left\{\frac{g(x, y)}{y}-b\right\} x y \\
&-\alpha \beta\{f(x, y, z)-a\} x z+\{\alpha \beta x+(1+a) y+(1+\delta) z\} p(t, x, y, z)
\end{align*}
$$

$0 \leq \theta_{1} \leq 1$ but $W_{1}=0$ when $z=0$. Hence

$$
W_{1} \geq 0 \quad \text { for all } x, y, z
$$

Similarly, it is clear that

$$
W_{2}=\frac{\{h(x, y, z)-h(x, 0,0)\}}{y} y^{2}=h_{y}\left(x, \theta_{2} y, 0\right) y^{2} \geq 0
$$

$0 \leq \theta_{2} \leq 1$ but $W_{2}=0$ when $y=0$. Hence

$$
W_{2} \geq 0 \quad \text { for all } x, y
$$

Also,

$$
W_{3}=\frac{\{h(x, y, z)-h(x, 0,0)\}}{z} z^{2}=h_{z}\left(x, 0, \theta_{3} z\right) z^{2} \geq 0
$$

$0 \leq \theta_{3} \leq 1$ but $W_{3}=0$ when $z=0$. Hence

$$
W_{3} \geq 0 \text { for all } x, z
$$

Then, combining the estimates $W_{1}, W_{2}, W_{3}$ and (iii) with (2.6) we obtain

$$
\begin{aligned}
\dot{V} \leq & -\alpha \beta \nu x^{2}-(a b-c-\alpha \beta a) y^{2}-(b-\delta c) y^{2}-(a \delta-1) z^{2} \\
& -a z^{2}-\alpha \beta\left\{\frac{g(x, y)}{y}-b\right\} x y-\alpha \beta\{f(x, y, z)-a\} x z \\
& +\{\alpha \beta x+(1+a) y+(1+\delta) z\} p(t, x, y, z) \\
=- & \frac{1}{2} \alpha \beta \nu x^{2}-\left\{a b-c-\alpha \beta\left[a+\nu^{-1}\left(\frac{g(x, y)}{y}-b\right)^{2}\right]\right\} y^{2} \\
& -(b-\delta c) y^{2}-\left\{a \delta-1-\alpha \beta \nu^{-1}[f(x, y, z)-a]^{2}\right\} z^{2}-a z^{2}
\end{aligned}
$$

Ultimate Boundedness of Solutions

$$
\begin{aligned}
& -\frac{1}{4} \alpha \beta \nu\left\{\left[x+2 \nu^{-1}\left(\frac{g(x, y)}{y}-b\right) y\right]^{2}+\left[x+2 \nu^{-1}(f(x, y, z)-a) z\right]^{2}\right\} \\
& +\{\alpha \beta x+(1+a) y+(1+\delta) z\} p(t, x, y, z)
\end{aligned}
$$

If we choose

$$
\alpha<\min \left\{\frac{a b-c}{\beta\left[a+\nu^{-1}\left(\frac{g(x, y)}{y}-b\right)^{2}\right]} ; \frac{1}{a} ; \frac{a \delta-1}{a b \delta} ; \frac{\nu(a \delta-1)}{\beta[f(x, y, z)-a]^{2}}\right\}
$$

it follows that

$$
\begin{aligned}
\dot{V} & \leq-\frac{1}{2} \alpha \beta \nu x^{2}-(b-\delta c) y^{2}-a z^{2}+\{\alpha \beta x+(1+a) y+(1+\delta) z\} p(t, x, y, z) \\
& \leq-D_{4}\left(x^{2}+y^{2}+z^{2}\right)+D_{5}(|x|+|y|+|z|)
\end{aligned}
$$

where

$$
D_{4}=\min \left\{\frac{1}{2} \alpha \beta \nu ; b-\delta c ; a\right\}, \quad D_{5}=A \max \{\alpha \beta ; 1+a ; 1+\delta\}
$$

## Moreover,

$$
\begin{equation*}
\dot{V} \leq-D_{4}\left(x^{2}+y^{2}+z^{2}\right)+D_{6}\left(x^{2}+y^{2}+z^{2}\right)^{\frac{1}{2}} \tag{2.7}
\end{equation*}
$$

where $D_{6}=3^{\frac{1}{2}} D_{5}$.
If we choose $\left(x^{2}+y^{2}+z^{2}\right)^{\frac{1}{2}} \geq D_{7}=2 D_{6} D_{4}^{-1}$, inequality (2.7) implies that

$$
\dot{V} \leq-\frac{1}{2} D_{4}\left(x^{2}+y^{2}+z^{2}\right)
$$

Title Page

We see at once that

$$
\dot{V} \leq-D_{8}
$$

provided that $x^{2}+y^{2}+z^{2} \geq 2 D_{8} D_{4}^{-1}$; and this completes the verification of (2.5).

## 3. Proof of Theorem 1.1

Let $(x(t), y(t), z(t))$ be any solution of (1.2). Then there is evidently a $t_{0} \geq 0$ such that

$$
x^{2}\left(t_{0}\right)+y^{2}\left(t_{0}\right)+z^{2}\left(t_{0}\right)<D_{3},
$$

where $D_{3}$ is the constant in the lemma; for otherwise, that is if

$$
x^{2}(t)+y^{2}(t)+z^{2}(t) \geq D_{3}, \quad t \geq 0
$$

then, by (2.5),

$$
\dot{V}(t) \leq-D_{2}<0, \quad t \geq 0
$$

and this in turn implies that $V(t) \rightarrow-\infty$ as $t \rightarrow \infty$, which contradicts (2.4). Hence to prove (1.3) it will suffice to show that if

$$
\begin{equation*}
x^{2}(t)+y^{2}(t)+z^{2}(t)<D_{9} \quad \text { for } \quad t=T \tag{3.1}
\end{equation*}
$$

where $D_{9} \geq D_{3}$ is a finite constant, then there is a constant $D_{10}>0$, depending on $a, b, c, \delta, \alpha$ and $D_{9}$, such that

$$
\begin{equation*}
x^{2}(t)+y^{2}(t)+z^{2}(t) \leq D_{10} \quad \text { for } \quad t \geq T \tag{3.2}
\end{equation*}
$$

Our proof of (3.2) is based essentially on an extension of an argument in the proof of [8, Lemma 1]. For any given constant $d>0$ let $S(d)$ denote the surface: $x^{2}+y^{2}+$ $z^{2}=d$. Because $V$ is continuous in $x, y, z$ and tends to $+\infty$ as $x^{2}+y^{2}+z^{2} \rightarrow \infty$, there is evidently a constant $D_{11}>0$, depending on $D_{9}$ as well as on $a, b, c, \delta$ and $\alpha$, such that

$$
\begin{equation*}
\min _{(x, y, z) \in S\left(D_{11}\right)} V(x, y, z)>\max _{(x, y, z) \in S\left(D_{9}\right)} V(x, y, z) . \tag{3.3}
\end{equation*}
$$

Ultimate Boundedness

It is easy to see from (3.1) and (3.3) that

$$
\begin{equation*}
x^{2}(t)+y^{2}(t)+z^{2}(t)<D_{11} \quad \text { for } \quad t \geq T \tag{3.4}
\end{equation*}
$$

For suppose on the contrary that there is a $t>T$ such that

$$
x^{2}(t)+y^{2}(t)+z^{2}(t) \geq D_{11} .
$$

Then, by (3.1) and by the continuity of the quantities $x(t), y(t), z(t)$ in the argument displayed, there exist $t_{1}, t_{2}, T<t_{1}<t_{2}$ such that

$$
\begin{equation*}
x^{2}\left(t_{1}\right)+y^{2}\left(t_{1}\right)+z^{2}\left(t_{1}\right)=D_{9} \tag{3.5a}
\end{equation*}
$$

$$
\begin{equation*}
x^{2}\left(t_{2}\right)+y^{2}\left(t_{2}\right)+z^{2}\left(t_{2}\right)=D_{11} \tag{3.5b}
\end{equation*}
$$

and such that

$$
\begin{equation*}
D_{9} \leq x^{2}(t)+y^{2}(t)+z^{2}(t) \leq D_{11}, \quad t_{1} \leq t \leq t_{2} \tag{3.6}
\end{equation*}
$$

But, writing $V(t) \equiv V(x(t), y(t), z(t))$, since $D_{9} \geq D_{3}$, (3.6) obviously implies [in view of (2.5)] that

$$
V\left(t_{2}\right)<V\left(t_{1}\right)
$$

and this contradicts the conclusion [from (3.3) and (3.5)]:

$$
V\left(t_{2}\right)>V\left(t_{1}\right)
$$

Hence (3.4) holds. This completes the proof of (1.3), and the theorem now follows.
Remark 1. Clearly, our theorem is an improvement and extension of Theorem A. In particular, from our theorem we see that (viii) assumed in Theorem A is not necessary, and (iv) and (ix) can be replaced by $h_{x}(x, 0,0) \leq c$ and (vi) of Theorem 1.1 respectively, for the ultimate boundedness of the solutions of Eq. (1.1).

Remark 2. Clearly, unlike in [7], the bounding constant $D$ in Theorem 1.1 does not depend on the solution of (1.1).
