# Riordan Arrays, Sheffer Sequences and "Orthogonal" Polynomials 

Giacomo Della Riccia<br>Dept. of Math. and Comp. Science - Research Center Norbert Wiener<br>University of Udine<br>Via delle Scienze 206<br>33100 Udine<br>Italy<br>dlrca@uniud.it

#### Abstract

Riordan group concepts are combined with the basic properties of convolution families of polynomials and Sheffer sequences, to establish a duality law, canonical forms $\rho(n, m)=\binom{n}{m} c^{m} F_{n-m}(m), c \neq 0$, and extensions $\rho(x, x-k)=(-1)^{k} x^{k+1} c^{x-k} F_{k}(x)$, where the $F_{k}(x)$ are polynomials in $x$, holding for each $\rho(n, m)$ in a Riordan array. Examples $\rho(n, m)=\binom{n}{m} S_{k}(x)$ are given, in which the $S_{k}(x)$ are "orthogonal" polynomials currently found in mathematical physics and combinatorial analysis.

## 1 Introduction

We derive from basic principles in the theory of convolution families [10] and Sheffer sequences [16] of polynomials, canonical forms $\rho(n, m)=\binom{n}{m} c^{m} \mathrm{~F}_{n-m}(m), c \neq 0$, and extensions $\rho(x, x-k)=x^{\underline{k}} c^{x-k} \mathrm{~F}_{k}(x-k) / k!=(-1)^{k} x^{k+1} c^{x-k} \rho_{k}(x)$, holding for all elements $\rho$ in the Riordan group. We show in Section 3 that the extensions are of polynomial type when $c=1$. In Section 2, we define transformation rules and a duality law, that will greatly simplify algebraic manipulations. In Section 4, we give examples $\rho(n, m)=\binom{n}{m} \mathrm{~S}_{n-m}(m)$, in which $\mathrm{S}_{k}(x)$ are "orthogonal" polynomials currently found in mathematical physics and combinatorial analysis. The concluding remarks are in Section 5.

For easy reference, we recall some definitions. The Riordan group is a set of invertible infinite lower triangular matrices $M=\{\rho(n, m)\}_{n, m \geq 0}$, called Riordan matrices, with entries:

$$
\begin{align*}
& \rho(n, m)=\left[\frac{u^{n}}{n!}\right] g(u) \frac{f(u)^{m}}{m!}=\frac{n!}{m!}\left[u^{n-m}\right] g(u)\left(\frac{f(u)}{u}\right)^{m}, \rho(0,0)=1  \tag{1}\\
& \text { equivalently, } \quad \sum_{n \geq m \geq 0} \rho(n, m) \frac{u^{n}}{n!}=g(u) \frac{f(u)^{m}}{m!} \quad \text { ("exponential" Riordan group), }
\end{align*}
$$

where $g(u)=1+g_{1} u+g_{2} u^{2}+\ldots$ is invertible, with $\widehat{g}(u)=1 / g(u)=\sum_{n>0} \widehat{g}_{n} u^{n}$, and $f(u)=$ $f_{1} u+f_{2} u^{2}+\ldots$ is a delta series with compositional inverse $\bar{f}(u), f(\bar{f}(u))=\bar{f}(f(u))=u$. A group element is denoted by $\rho=(g(u), f(u))$ and the group law $\star$ is $(l(u), h(u)) \star$ $(g(u), f(u))=\left(l(u) g(h(u)), f(h(u))\right.$, with identity $I=(1, u)$ and group inverse $\rho^{-1}=$ $(1 / g(\bar{f}(u)), \bar{f}(u))$. A group representation $\rho=\rho_{1} \star \rho_{2}$, in matrix notation, is $\rho(n, m)=$ $\sum_{i} \rho_{1}(n, i) \rho_{2}(i, m)$. As we know, group representations are extensively used in the study of identities [13, 18, 14, 15] and they will play an essential role in this work. A sequence $a_{k}(x)$, given by $\sum_{k} a_{k}(x) u^{k}=a(u)^{x}$, is a convolution family of polynomials iff $a(0)=1$ [10]. In a convolution family the polynomials $a_{k}(x)$ are multiples of $x$ for $k>0$, having degree $\leq k$, and $x a_{0}(x) \equiv 1$. A Sheffer sequence $\mathcal{S}_{k}(x)$ for $(g(u), f(u))$ [16] is given by $\sum_{k \geq 0} \mathcal{S}_{k}(x) u^{k} / k!=(1 / g(\bar{f}(u))) e^{x \bar{f}(u)}$, where $(g(u), f(u))$ are as in Riordan group theory; the Sheffer sequence for $f=(1, f(u))$ is the associated sequence for $f(u)$, and the Sheffer sequence for $(g(u), u)$ is the Appell sequence for $g(u)$.

## 2 Transformation Rules and the Duality Law

We first define some useful transformation rules, noting that transformation rules and Barry's "transforms" [2] are different concepts.

1) The duality rule " $\sim$ " for a function $f(n, m), n, m$ integers, is $\widetilde{f}(n, m)=f(-m,-n)$ and for a function $f_{k}(x)$, the rule is $\widetilde{f}_{k}(x)=f_{k}(k-x)$. When $x=n$ and $k=n-m$, the two rules coincide. The following special cases will be used in the sequel, without reference.

$$
\begin{aligned}
& \widetilde{\binom{n}{m}}=\binom{n}{n-m}=\binom{-m}{n-m}=(-1)^{n-m}\binom{n-1}{m-1}, \quad n \geq m \geq 0 \\
& \widetilde{n!}=\widetilde{n^{n-m}}=(-m)^{\frac{n-m}{m!}}=(-1)^{n-m}(n-1)^{n-m}=(-1)^{n-m} \frac{n!}{m!} \frac{m}{n} \\
& \frac{n!}{(m-1)!}=n^{\frac{n-m+1}{n}}=(-1)^{n-m+1} \frac{n!}{(m-1)!}
\end{aligned}
$$

The dual $\widetilde{\rho}(n, m)$ of $\rho(n, m)$ and the dual of a group representation $\rho=\rho_{1} \star \rho_{2}$ are

$$
\begin{aligned}
& \widetilde{\rho}(n, m)=\rho(-m,-n)=(-1)^{n-m} \frac{n!}{m!} \frac{m}{n}\left[u^{n-m}\right] g(u)\left(\frac{f(u)}{u}\right)^{-n} \quad \text { from }(1), \\
& \widetilde{\rho}(n, m)=\sum_{i} \rho_{1}(-m,-i) \rho_{2}(-i,-n)=\sum_{i} \widetilde{\rho_{2}}(n, i) \widetilde{\rho_{1}}(i, m), \quad \widetilde{\rho}=\widetilde{\rho_{2}} \star \widetilde{\rho_{1}}
\end{aligned}
$$

after a change $i \rightarrow-i$; this change is legal because we are allowed to use summation $\sum_{i}$ over an unbounded range.
2) For any number $\mu$, the scaling rule " $(\mu)$ " is a group automorphism:

$$
\begin{aligned}
& (\mu) \rho=(1, \mu u) \star \rho \star\left(1, \frac{u}{\mu}\right)=\left(g(\mu u), \frac{f(\mu u)}{\mu}\right), \quad \lim _{\mu \rightarrow 0}(\mu)(g(u), f(u))=(1, u)=I, \\
& ((\mu) \rho)(n, m)=\mu^{n-m} \rho(n, m), \quad((\mu) \rho)^{-1}=(\mu) \rho^{-1}, \quad(\mu)\left(\rho_{1} \star \rho_{2}\right)=(\mu) \rho_{1} \star(\mu) \rho_{2} .
\end{aligned}
$$

3) The negation rule " $(-)$ " is the special scaling $\mu=-1$ :

$$
(-) \rho=(g(-u),-f(-u)): \quad((-) \rho)(n, m)=(-1)^{n-m} \rho(n, m)
$$

Duality and negation applied to (1) and Lagrange's inversion formula yield, respectively,

$$
\begin{aligned}
(-1)^{n-m} \widetilde{f}(n, m) & =(-1)^{n-m} f(-m,-n)=\frac{n!}{m!} \frac{m}{n}\left[u^{n-m}\right]\left(\frac{f(u)}{u}\right)^{-n} \\
f^{-1}(n, m) & =\frac{n!}{m!}\left[u^{n}\right] \bar{f}(u)^{m}=\frac{n!}{m!} \frac{m}{n}\left[u^{n-m}\right]\left(\frac{f(u)}{u}\right)^{-n}
\end{aligned}
$$

Combining the two formulas, we find a duality law in the associated subgroup $\{(1, f(u))\}$ :

$$
\begin{equation*}
f^{-1}(n, m)=(-1)^{n-m} \widetilde{f}(n, m), \quad f^{-1}=(-) \widetilde{f} \tag{2}
\end{equation*}
$$

For $g$ in the Appell subgroup $\{(g(u), u)\}$ and $\rho^{-1}=f^{-1} \star g^{-1}=(-) \widetilde{f} \star g^{-1}$, (1) yields:

$$
\begin{aligned}
& g(n, m)=\frac{n!}{m!} g_{n-m}=\binom{n}{m}(n-m)!g_{n-m}, \quad g^{-1}(n, m)=\binom{n}{m}(n-m)!\widehat{g}_{n-m}, \\
& \rho^{-1}(n, m)=\sum_{i=0}^{n-m}(-1)^{i} \widetilde{f}(n, n-i)(n-i)^{\underline{n-m-i}} \widehat{g}_{n-m-i} .
\end{aligned}
$$

## 3 Canonical Forms and Extensions

Let us write the delta series $f(u)$ in $f=(1, f(u))$ and the defining relation (1) as:

$$
\begin{align*}
& f(u)=u c a(u)=u c\left(1+a_{1} u+\cdots\right), \quad c \neq 0, \\
& \rho(n, m)=\binom{n}{m} c^{m}\left[\frac{u^{n-m}}{(n-m)!}\right] g(u)\left(\frac{f(u)}{c u}\right)^{m}=\binom{n}{m} c^{m} F_{n-m}(m), \tag{3}
\end{align*}
$$

and call $c \neq 0$ the weight of $f,\left\{c a_{n}\right\}$ the $f$-reference sequence ( $f$-refseq) and $\binom{n}{m} c^{m} F_{n-m}(m)$ the canonical form of $\rho(n, m)$. The remarkable structure of canonical forms, namely, a binomial coefficient multiplied by a factor $c^{m} F_{n-m}(m)$, implies the following.

Proposition 1. A numerical array with entries $\rho(n, m)=\binom{n}{m} c^{m} F_{n-m}(m)$ is a Riordan matrix iff the $F_{k}(x)$ are polynomials forming a Sheffer sequence.

Proof. If the $\rho(n, m)$ are numbers related to an element $\rho=(g(u), f(u))$, then according to (3) we can write

$$
\sum_{n-m} \frac{F_{n-m}(m)}{(n-m)!} u^{n-m}=g(u) e^{m \ln \left(\frac{f(u)}{c u}\right)}=g(u)\left(\frac{f(u)}{c u}\right)^{m}
$$

thus the $F_{k}(x)$ form a Sheffer sequence given by $\sum_{k} F_{k}(x) u^{k} / k!=g(u) e^{x \ln (f(u) / c u)}$. Conversely, if the above Sheffer sequence is given, then, by letting $x=m$, we obtain (3), proving that the $\rho(n, m)$ define a Riordan matrix.

Corollary 2. Each $\rho(n, m)$ in a Riordan matrix has an extension

$$
\begin{equation*}
\rho(x, x-k)=(-1)^{k} x^{\underline{k+1}} \rho_{k}(x), \quad \rho_{k}(x)=c^{x-k} \frac{(-1)^{k}}{k!} \frac{F_{k}(x-k)}{x-k}, \tag{4}
\end{equation*}
$$

which is of polynomial type when $c=1$.
Proof. Since $F_{n-m}(m)$ is a polynomial in $m$, we can put in the canonical form $n-m=k$, $n=x$ and $m=x-k$, thus obtaining immediately well-defined extensions (4), which are clearly of polynomial type when $c=1$.

Since $f(u) / c u=a(u)$ is invertible and $a(0)=1$, the coefficients $(-1)^{k} x f_{k}(x+k)$ in the power series expansion of $(f(u) / c u)^{x}$, written as $(f(u) / c u)^{x}=x \sum_{k}(-1)^{k} f_{k}(x+k) u^{k}$, form a convolution family. Similarly, (1) written for $f^{-1}(n, m)=(-1)^{n-m} \widetilde{f}(n, m)$, with $u \rightarrow c u$ and $m=-x$, implies:

$$
\begin{aligned}
\left(\frac{c \bar{f}(u)}{u}\right)^{m} & =-m \sum_{n-m \geq 0}(-1)^{n-m} f_{n-m}(-m) \frac{u^{n-m}}{c^{n-m}} \\
\left(\frac{\bar{f}(c u)}{u}\right)^{-x} & =\left(\frac{\overline{f(u) / c}}{u}\right)^{-x}=x \sum_{k \geq 0}(-1)^{k} f_{k}(x) u^{k}, \quad c \bar{f}\left(f\left(\frac{u}{c}\right)\right)=u
\end{aligned}
$$

showing that the $(-1)^{k+1} x f_{k}(-x)$ form a convolution family for $(\overline{f(u) / c} / u)^{x}$. Moreover,

$$
\begin{aligned}
f(n, m) & =(-1)^{n-m} \frac{n!}{(m-1)!} c^{m} f_{n-m}(n) \\
f^{-1}(n, m) & =(-1)^{n-m} \widetilde{f}(n, m)=(-1)^{n-m+1} \frac{n!}{(m-1)!} c^{-n} f_{n-m}(-m) \\
f(x, x-k) & =c^{x-k}(-1)^{k} x \frac{k+1}{} f_{k}(x), \quad f^{-1}(x, x-k)=c^{-x}(-1)^{k+1} x^{k+1} f_{k}(k-x)
\end{aligned}
$$

The $f_{k}(x), k>0$, will be called the $f$-polynomial sequence ( $f$-polseq).
One can verify that if $f$ has weight $c$, then $f^{-1}$ has weight $1 / c$, and that changes of scale keep weights invariant, hence, they cannot modify the characteristics of an extension.

For $g \in\{(g(u), u)\}$, we have simply:

$$
\begin{aligned}
g(n, m) & =\binom{n}{n}(n-m)!g_{n-m}, \quad g^{-1}(n, m)=\binom{n}{n}(n-m)!\widehat{g}_{n-m}, \\
g(x, x-k) & =g_{k} x^{\underline{k}}, \quad g^{-1}(x, x-k)=\hat{g}_{k} x^{\underline{k}} .
\end{aligned}
$$

For $\rho(n, m)$, in addition to (3) and (4), and for $\rho^{-1}(n, m)$ we write relations that, when $g(u) \equiv 1$, reduce to the corresponding expressions for $f(n, m)$ and $f^{-1}(n, m)$ :

$$
\begin{aligned}
\rho(n, m) & =(-1)^{n-m} \frac{n!}{(m-1)!} \rho_{n-m}(n), \\
\rho^{-1}(n, m) & =\binom{n}{m} c^{-n} G_{n-m}(m)=(-1)^{n-m+1} \frac{n!}{(m-1)!} \rho_{n-m}^{-1}(-m), \\
\rho^{-1}(x, x-k) & =(-1)^{k+1} x^{k+1} \rho_{k}^{-1}(k-x), \quad \rho_{k}^{-1}(x)=c^{-x} \frac{(-1)^{k}}{k!} \frac{G_{k}(-x)}{x} .
\end{aligned}
$$

When the nonzero entries in a $f$-refseq are of the same sign, we say that $\rho=(g(u), f(u))$ is of the second kind, otherwise, of the first kind. In a pair $\left\{\rho, \rho^{-1}\right\}$, at most one element can be of the 2 nd kind; when such an element exists, it will be denoted $\rho^{-1}$. Similarly, capital letters in an inverse pair $\{\phi, \Phi\}$ will, in general, indicate elements of the 2nd kind.

Duality defines a dual element $\widetilde{\rho}$ that extends $\rho(n, m)$ to all integers $n$, $m$, and since, as we have seen, $\widetilde{\rho}(n, m), \rho(n, m)$ and $\rho^{-1}(n, m)$ are tied together, it is natural to include these numbers in a single extended $\rho$-array that will represent the pair $\left\{\rho, \rho^{-1}\right\}$.

We adopt the term generalized numbers for the $\rho(n, m)$ in the sense that these numbers extend to all integer values $n, m$. The $\rho$-refseq: $c \sum_{i=0}^{n} g_{i} a_{n-i}$ given by

$$
\frac{\rho(n+1,1)}{(n+1)!}=c\left[u^{n}\right] g(u) \frac{f(u)}{c u}=c\left[u^{n}\right] g(u) a(u)=c \sum_{i=0}^{n} g_{i} a_{n-i} .
$$

## 4 Riordan Arrays and "Orthogonal" Polynomials

Consider a Sheffer sequence $\mathcal{S}_{k}(x)$ for $(g(u), f(u))$ and the elements $\mathrm{U}=\left(1 / g(\bar{f}(u)), u e^{\bar{f}(u)}\right)$ and $C=(1 / g(\bar{f}(u)), \bar{f}(u))$, then we can write:

$$
\begin{aligned}
& \sum_{k \geq 0} \frac{\mathcal{S}_{k}(x)}{k!} u^{k}=\frac{e^{x \bar{f}(u)}}{g(\bar{f}(u))}=\sum_{i \geq 0} x^{i} \frac{1}{i!} \frac{\bar{f}(u)^{i}}{g(\bar{f}(u))}=\sum_{i \geq 0} x^{i} \sum_{k \geq 0} C(k, i) \frac{u^{k}}{k!}, \\
& \mathcal{S}_{k}(x)=\sum_{i=0}^{k} C(k, i) x^{i}, \quad C(n, m)=\binom{n}{m}\left[\frac{u^{n-m}}{(n-m)!}\right] \frac{\left(\frac{\bar{f}(u)}{u}\right)^{m}}{g(\bar{f}(u))}, \\
& \mathrm{U}(n, m)=\binom{n}{m}\left[\frac{u^{n-m}}{(n-m)!}\right] \frac{e^{m \bar{f}(u)}}{g(\bar{f}(u))}=\binom{n}{m} \mathcal{S}_{n-m}(m)=\frac{(-1)^{n-m+1} n!}{(m-1)!} \mathrm{U}_{n-m}(-m), \\
& \mathrm{U}(x, x-k)=(-1)^{k+1} x^{k+1} \mathrm{U}_{k}(k-x), \quad \mathrm{U}_{k}(x)=\frac{(-1)^{k}}{k!} \frac{\mathcal{S}_{k}(-x)}{x}, k>0, \quad \mathrm{U}_{0}(x)=\frac{1}{x} .
\end{aligned}
$$

An immediate consequence of these equations is the following important relationship between Riordan group elements and Sheffer sequences.

Proposition 3. $S_{k}(x)=\sum_{i=0}^{k} C(k, i) x^{i}$ are polynomials forming a Sheffer sequence for $(g(u), f(u))$ iff the coefficients $C(n, m)$ are generalized numbers for $C=(1 / g(f(u)), \bar{f}(u))$.

We now give examples where the $S_{k}(x)$ are classical "orthogonal" polynomials, currently found in mathematical physics and combinatorial analysis.

Example 1. In the typical Stirling-array $\left\{s=(1, \ln (1+u)), S=\left(1, e^{u}-1\right)\right\}$, we have:

$$
\begin{aligned}
& s(n, m)=(-1)^{n-m} \frac{n!}{(m-1)!} \sigma_{n-m}(n), \quad S(n, m)=(-1)^{n-m+1} \frac{n!}{(m-1)!} \sigma_{n-m}(-m) ; \\
& s(x, x-k)=(-1)^{k} x^{\frac{k+1}{} \sigma_{k}(x), \quad S(x, x-k)=(-1)^{k+1} x^{k+1} \sigma_{k}(k-x) ;} \\
& \text { Stirling-polseq : } \sigma_{k}(x) ; s \text {-refseq : } \frac{(-1)^{n}}{n+1}, \quad S \text {-refseq : } \frac{1}{(n+1)!} \\
& \left(\frac{\ln (1+u)}{u}\right)^{x}=x \sum_{k \geq 0}(-1)^{k} \sigma_{k}(x+k) u^{k}, \quad\left(\frac{e^{u}-1}{u}\right)^{-x}=x \sum_{k \geq 0}(-1)^{k} \sigma_{k}(x) u^{k} .
\end{aligned}
$$

The Stirling-array is related to the Exponential Polynomials $\phi_{k}(x)$ [12, p. 63] forming the associated sequence for $f(u)=\ln (1+u), \quad \bar{f}(u)=e^{u}-1, \quad \gamma^{-1}=\left(1, e^{u}-1\right)$ :

$$
\begin{aligned}
\sum_{k} \frac{\phi_{k}(x)}{k!} u^{k} & =e^{x \bar{f}(u)}=e^{x\left(e^{u}-1\right)}, \quad C(n, m)=S(n, m): \text { Stirling numbers (2d kind) } \\
\Phi=\mathrm{U} & =\left(1, u e^{e^{u}-1}\right), \quad \phi_{k}(x)=\sum_{i=0}^{k} S(k, i) x^{i}: \text { Touchard polynomials; } \\
\Phi(n, m) & =\binom{n}{m} \phi_{n-m}(m)=\frac{(-1)^{n-m+1} n!}{(m-1)!} \Phi_{n-m}(-m), \quad \Phi_{k}(x)=\frac{(-1)^{k}}{k!} \frac{\phi_{k}(-x)}{x} ; \\
\phi_{k}(1) & =\varpi_{n}=\sum_{i=0}^{k} S(k, i): \text { Bell numbers, given by } e^{e^{u}-1}=\sum_{k} \varpi_{n} u^{k} / k!.
\end{aligned}
$$

The Iterated Exponential Polynomials $\phi_{k}^{[q]}(x)$ form the associated sequence for $f(u)=$ $s^{[q]}(u)=s\left(s^{[q-1]}(u)\right), s^{[0]}=u ; \quad \bar{f}(u)=S^{[q]}(u)=S\left(S^{[q-1]}(u)\right), S^{[0]}=u:$

$$
\begin{aligned}
\sum_{k} \frac{\phi_{k}^{[q]}(x)}{k!} u^{k} & =e^{x S^{[q]}}, \quad \phi_{k}^{[q]}(x)=\sum_{i=0}^{k} S^{[q]}(k, i) x^{i} ; \quad S^{[q]}=\underbrace{S \star S_{\star} \ldots \star S}_{q \text { terms }} \\
\Phi^{[q]}=\mathrm{U}^{[q]} & =\left(1, u e^{S^{[q]}(u)}\right), \quad \Phi^{[1]}=\Phi, \quad C^{[q]}=\left(1, S^{[q]}(u)\right) \\
S^{[q]}(n, m) & =\binom{n}{m} \phi_{n-m}^{[q]}(m), \quad \Phi_{k}^{[q]}(x)=\frac{(-1)^{k}}{k!} \frac{\phi_{k}^{[q]}(-x)}{x}
\end{aligned}
$$

The $\underline{\text { Stirling-array }}$ corresponds to $q=1$, and for $q=2$, we have the $\underline{\operatorname{Stir}^{[2]} \text {-array }}\{\beta=$
$(1, \beta(u)), \mathcal{B}\}, \quad \beta(u)=\ln (1+\ln (1+u)), \quad \mathcal{B}(u)=e^{e^{u}-1}-1, \quad \mathcal{B}$-refseq : $\varpi_{n+1} /(n+1)!$,

$$
\begin{aligned}
& \beta(n, m)=\sum_{i=m}^{n} s(n, i) s(i, m), \quad \mathcal{B}(n, m)=\sum_{i=m}^{n} S(n, i) S(i, m) \\
& \sum_{k} \frac{\phi_{k}^{[2]}(x)}{k!} u^{k}=e^{x \ln (1+\ln (1+u))}=(1+\ln (1+u))^{x}, \quad \phi_{k}^{[2]}(x)=\sum_{j \geq i \geq 0}^{k} s(k, j) s(j, i) x^{i}, \\
& \text { Stir }{ }^{[2]} \text {-polseq : } \sigma_{k}^{[2]}(x)=\sum_{i=0}^{k}(x-i) \sigma_{k-i}(x-i) \sigma_{i}(x) .
\end{aligned}
$$

Example 2. For the Lah-array $\{\lambda, \Lambda=(1, \Lambda(u))\}^{1}, \quad \Lambda(u)=-\lambda(-u)=u /(1-u / 2)$ :
and for the Pascal-array $\{p, P=(1 /(1-u), u /(1-u))\}, \quad p=P^{-1}=(-) P:$

$$
P(n, m)=\frac{(-1)^{n-m+1} n!}{(m-1)!} \operatorname{Pas}_{k}(-m)=\frac{n!}{m!}\left[u^{n-m}\right] \frac{1}{(1-u)^{m+1}}=\binom{n}{m} \frac{n!}{m!} \text { by }[8,(5.56)]
$$

$$
\text { Pascal-polseq : } \operatorname{Pascal}_{k}(x)=\frac{(-1)^{k}}{k!}(x-1)^{\frac{k-1}{}}
$$

The above arrays are related to the Laguerre Polynomials $L_{k}^{(a)}(x)$ of order $a[12$, p. 31, p. 108] forming the Sheffer sequence for $\left(g(u)=(1+u)^{-a-1}, f(u)=u /(u-1)=\bar{f}(u)\right)$, given by $\sum_{k} L_{k}^{(a)}(x) u^{k} / k!=(1-u)^{-a-1} e^{x u /(u-1)} ; \quad L_{k}^{\{0\}}(x)$ : (simple) Laguerre polynomials.

$$
\begin{align*}
\operatorname{Lag}^{(a)}=\mathrm{U} & =\left((1-u)^{-a-1}, u e^{\bar{f}(u)}\right), \quad C^{(a)}=\left((1-u)^{-a-1}, \frac{u}{u-1}\right), \\
\operatorname{Lag}^{(a)}(n, m) & =\binom{n}{m} L_{n-m}^{\{a\}}(m)=(-1)^{n-m+1} \frac{n!}{(m-1)!} \operatorname{Lag}_{n-m}^{(a)}(-m), \\
C^{(a)}(n, m) & =(-1)^{m} \frac{n!}{m!}\left[u^{n-m}\right](1-u)^{-a-1-m}=(-1)^{m} \frac{n!}{m!}\binom{a+n}{n-m}, \text { by }[8,(5.56)], \\
L_{k}^{(a)}(x) & =\sum_{i=0}^{k} C^{(a)}(k, i) x^{i}=\sum_{i=0}^{k} \frac{k!}{i!}\binom{a+k}{k-i}(-x)^{i} . \tag{5}
\end{align*}
$$

The Lah-array corresponds to $a=-1$ and the Pascal-array to $a=0$.

[^0]Example 3. Let us consider the Tanh-array $\{\theta=(1, \theta(u)), \Theta=(1, \Theta(u))\}$, with

$$
\begin{aligned}
& \theta(u)=2 \frac{e^{u}-1}{e^{u}+1}=2 \tanh \frac{u}{2}, \Theta(u)=\ln \frac{1+u / 2}{1-u / 2}=2 \arg \tanh \frac{u}{2}, \Theta=\Lambda \star s, S=\Lambda \star \theta: \\
& \theta(n, m)=(-1)^{n-m} \frac{n!}{(m-1)!} \delta_{n-m}(n), \quad \Theta(n, m)=(-1)^{n-m+1} \frac{n!}{(m-1)!} \delta_{n-m}(-m), \\
& \delta_{k}(x)=\sum_{i=0}^{k} \frac{(-1)^{i+1}}{2^{i}} \frac{(k-x-1)^{\underline{i}}}{i!} \sigma_{k-i}(k-x-i), \quad \sigma_{k}(x)=-\sum_{i=0}^{k} \frac{(x-1)^{\underline{i}}}{2^{i} i!} \delta_{k-i}(k-x),
\end{aligned}
$$

Tanh-polseq : $\delta_{k}(x)$.
The Tanh-array and the Tangent-array $\{\arctan =(1, \arctan u), \tan =(1, \tan u)\}$ are related by the elementary trigonometric formulas:

$$
\tan u=\frac{1}{\imath} \tanh (\imath u)=\frac{1}{2 \imath} 2 \tanh \left(2 \imath \frac{u}{2}\right)=\frac{\theta(2 \imath u)}{2 \imath}, \quad \arctan u=\frac{1}{\imath} \arg \tanh (\imath u)=\frac{\Theta(2 \imath u)}{2 \imath},
$$

which look like a scaling of $\theta$ and $\Theta$ with $\mu=2 \imath, \imath^{2}=-1: \tan (n, m)=(2 \imath)^{n-m} \theta(n, m)$, $\arctan (n, m)=(2 \imath)^{n-m} \Theta(n, m)$. The numbers tan $(n, m)$ and $\arctan (n, m)$ appear in Comtet [4, p.p.259-260] as $T(n, k)$ and $t(n, k)$. Putting $T(n, m)=(2 \imath)^{n-m}(n!/(m-1)!) \delta_{n-m}(n)$ in the recursion for $T(n, k)$ and after common factors are divided out, we are left with

$$
\begin{align*}
& (x+1) \delta_{k}(x+1)=(x-k) \delta_{k}(x)-\frac{x-k+2}{4} \delta_{k-2}(x), \quad \delta_{k}(x) \equiv 0, k<0, x \delta_{0}(x) \equiv 1 \\
& \left(\operatorname{compare} \operatorname{with}(x+1) \sigma_{k}(x+1)=(x-k) \sigma_{k}(x)+x \sigma_{k-1}(x)[8, \text { Exercise 6.18]}\right. \tag{6}
\end{align*}
$$

One can prove by induction that the $\delta_{k}(x), k=2 j>0$, have degree $j-1$ and $\delta_{k}(x) \equiv 0$ when $k$ is odd; hence factors $(-1)^{k}$ may be omitted, leaving us with simplified formulas:

$$
\left(\frac{2 \tanh \frac{u}{2}}{u}\right)^{x}=x \sum_{k \geq 0} \delta_{k}(x+k) u^{k}, \quad\left(\frac{1}{u} \ln \frac{1+\frac{u}{2}}{1-\frac{u}{2}}\right)^{-x}=x \sum_{k \geq 0} \delta_{k}(x) u^{k} ; \quad \Theta=\widetilde{\theta}
$$

The Tanh-array is related to the Mittag-Leffler Polynomials $M_{k}(x)$ [12, p.75] forming the associated sequence for

$$
\begin{gather*}
f(u)=\frac{e^{u}-1}{e^{u}+1}=\tanh \frac{u}{2}, \quad \bar{f}(u)=\ln \frac{1+u}{1-u}=2 \arg \tanh u, \quad \sum_{k} \frac{M_{k}(x)}{k!} u^{k}=\left(\frac{1+u}{1-u}\right)^{x} . \\
\operatorname{MiLef}=\mathrm{U}=\left(1, u \frac{1+u}{1-u}\right), \quad C=(1,2 \arg \tanh u), \quad \operatorname{MiLef}_{k}(x)=\frac{(-1)^{k}}{k!} \frac{M_{k}(-x)}{x}, \\
\operatorname{MiLef}(n, m)=\binom{n}{m} M_{n-m}(m)=\frac{(-1)^{n-m+1} n!}{(m-1)!} \operatorname{MiLef}_{n-m}(-m) \\
\left.M_{k}(x)=2^{k} \sum_{i=0}^{k} \Theta(k, i) x^{i}=2^{k} \sum_{i=0}^{k} \sum_{j} \Lambda(k, j)\right) s(j, i) x^{i}=\sum_{j=0}^{k} \frac{k!}{j!}\binom{k-1}{k-j} 2^{j} x^{\underline{j}}, \tag{7}
\end{gather*}
$$

where we used the identity $\sum_{i} s(j, i) x^{i}=x^{j}$.
Example 4. The simple Binom-array $\left\{b i n=\left(\exp ^{-u}, u\right)\right.$, Bin $\}$,
$\operatorname{bin}(n, m)=(-1)^{n-m}\binom{n}{m}, \operatorname{Bin}(n, m)=\binom{n}{m}, \quad \operatorname{Bin}(x, x-k)=(-1)^{k} \operatorname{bin}(x, x-k)=\frac{x^{\underline{k}}}{k!}$,
is related to the Poisson-Charlier Polynomials $c_{k}^{\{a\}}(x)=a^{-k} L_{k}^{\{x-k\}}(a)$ [12, p.119], since the egf of $c_{k}^{\{a\}}(0)=a^{-k} L_{k}^{\{-k\}}(a)=\left(\underline{-1)^{k}}\right.$ is $e^{-u}$, by using $L_{k}^{\{-k\}}(a)=(-1)^{k} a^{k}$ from (5). The Tree-array $\left\{r=\left(1, u e^{-u}\right), R=\left(1, \overline{u e^{-u}}\right)\right\}$,

$$
\begin{aligned}
r(n, m) & =(-1)^{n-m}\binom{n}{m} m^{n-m}, \quad R(n, m)=\binom{n}{m} \frac{m}{n} n^{n-m}, \\
\left(\frac{r(u)}{u}\right)^{x} & =e^{-x u},\left(\frac{R(u)}{u}\right)^{-x}=x \sum_{k} \frac{(-1)^{k}}{k!}(x-k)^{k-1} u^{k}, \quad \operatorname{Tree}_{k}(x)=\frac{1}{k!}(x-k)^{k-1}, \\
R(n, 1) & =n^{n-1}: \text { number of rooted trees of } n \text { vertices [4, p.152]. }
\end{aligned}
$$

can be related to the case $a=-1$ of the Abel Polynomials $A_{k}(x ; a), a \neq 0,[12, \mathrm{p} .73]$, forming the associated sequence for $f(u)=u e^{a u} ; \bar{f}(u)=\overline{u e^{a u}}, A_{k}(x ; a)=x(x-a k)^{k-1}$.

$$
\begin{aligned}
& \operatorname{Abel}^{(a)}=\mathrm{U}^{(a)}=\left(1, u e^{\overline{\overline{u e a u}}}\right), \quad \operatorname{Abel}_{k}^{(a)}(x)=\frac{(-1)^{k}}{k!} \frac{A_{k}(-x ; a)}{x}, \quad C^{(a)}=\left(1, \overline{u e^{a u}}\right) ; \\
& \operatorname{Abel}^{(a)}(n, m)=(-1)^{n-m+1} \frac{n!}{(m-1)!} \operatorname{Abel}_{n-m}^{(a)}(-m)=\binom{n}{m} A_{n-m}(m ; a) .
\end{aligned}
$$

$$
\text { For } a=-1, \operatorname{Abel}_{k}^{(-1)}(x)=(-1)^{k} \sum_{i=0}^{k}\binom{k}{i} i^{k-i}(-x)^{i}, \quad\binom{k}{i} i^{k-i} \text { : idempotent numbers. }
$$

Example 5. The Sinh-array $\{\operatorname{argshin}=(1,2 \arg \sinh (u / 2) / b)$, shin $=(1,2 \sinh (b u / 2))\}$ is related to the Gould Polynomials $G_{k}(x ; a, b), b \neq 0,[12, \mathrm{p} .67]$ forming the associated sequence for $f(u)=e^{a u}\left(e^{b u}-1\right), b \neq 0$. In fact, when $a=-b / 2, G_{k}(x ; b)=G_{k}(x ;-b / 2, b)$, $f(u)=e^{b u / 2}-e^{-b u / 2}=2 \sinh (b u / 2), c=b, \quad \bar{f}(u)=2 \arg \sinh (u / 2) / b$,

$$
\sum_{k} G_{k}(x ; b) u^{k} / k!=e^{x(2 / b) \arg \sinh (u / 2)}=\mathcal{B}_{1 / 2}(u)^{x / b}=\left(u / 2+\sqrt{1+u^{2} / 4}\right)^{2 x / b}[10, \text { p.71] }
$$

where $\mathcal{B}_{1 / 2}(u)=\left(u / 2+\sqrt{1+u^{2} / 4}\right)^{2}$ is a generalized binomial series [8, p.203].

$$
\begin{aligned}
\operatorname{Gould}^{(b)}=\mathrm{U}^{(b)} & =\left(1, u e^{\frac{2}{b} \arg \sinh \frac{u}{2}}\right), \quad \operatorname{Gould}_{k}^{(b)}(x)=\frac{(-1)^{k}}{k!} \frac{G_{k}(-x ; b)}{x} \\
\operatorname{Gould}^{(b)}(n, m) & =(-1)^{n-m+1} \frac{n!}{(m-1)!} \operatorname{Gould}_{n-m}^{(b)}(-m)=\binom{n}{m} G_{n-m}(m ; b) \\
G_{k}(x ; 1) & \left.=x\left(x+\frac{1}{2} k-1\right)\right)^{\frac{k-1}{}}: \text { central factorial polynomials [12, p.68]. }
\end{aligned}
$$

Example 6. The Bernoulli Polynomials $B_{k}^{(a)}(x)$ of order $a, a \neq 0$, [12, p.93] form the Appell sequence for $g(u)=\left(\left(e^{u}-1\right) / u\right)^{a}$, given by $\sum_{k} B_{k}^{(a)}(x) u^{k} / k!=\left(u /\left(e^{u}-1\right)\right)^{a} e^{x u}$. $B_{k}^{(m)}=B_{k}^{(m)}(0)$ are the higher order Bernoulli numbers and $B_{k}=B_{k}^{(1)}$ are the Bernoulli numbers given by $\sum_{k} B_{k} u^{k} / k!=u /\left(e^{u}-1\right)=B(u)$.

$$
\begin{aligned}
& \operatorname{Bern}^{(a)}=\mathrm{U}=\left(\left(\frac{u}{e^{u}-1}\right)^{a}, \quad u e^{u}\right), \quad \operatorname{Bern}^{(a)}(n, m)=\binom{n}{m} B_{n-m}^{(a)}(m) \\
& C^{(a)}=\left(\left(\frac{u}{e^{u}-1}\right)^{a}, u\right), \quad C^{(a)}(n, m)=\binom{n}{m} B_{n-m}^{(a)}, \\
& B_{k}^{(a)}(x)=\sum_{i=0}^{k}\binom{k}{i} B_{k-i}^{(a)} x^{i}, \quad B_{k}(x)=\sum_{i=0}^{k}\binom{k}{i} B_{k-i} x^{i}: \text { Bernoulli polynomials. }
\end{aligned}
$$

The Nörlund polynomials $B_{k}^{(x)}=B_{k}^{(x)}(0)$ [1] form the associated sequence for $\overline{\ln B(u)}$,

$$
\begin{align*}
& \sum_{k} \frac{B_{k}^{(x)}}{k!} u^{k}=e^{x \ln B(u)}=\left(\frac{e^{u}-1}{u}\right)^{-x}=x \sum_{k \geq 0}(-1)^{k} \sigma_{k}(x) u^{k}, \\
& \frac{B_{k}^{(x)}}{x k!}=(-1)^{k} \sigma_{k}(x)=\frac{s(x, x-k)}{x^{k+1}}, \frac{B_{k}^{(-x)}}{x k!}=(-1)^{k+1} \sigma_{k}(-x)=\frac{S(x+k, x)}{(x+k)^{\frac{k+1}{\prime}}},  \tag{8}\\
& \frac{B_{k}}{k!}=\sigma_{k}(1)-[k=1]=-k \sigma_{k}(0), k>0, \quad \text { by the recursion }(6) . \tag{9}
\end{align*}
$$

For the $\underline{B e r n-a r r a y}\{$ ber, $\operatorname{Ber}=(1, u B(u))\}, \quad \operatorname{Ber}$-refseq: $B_{n} / n$ !, we have

$$
\operatorname{Ber}(n, m)=\binom{n}{m} B_{n-m}^{(m)}, \quad \operatorname{Bern}_{k}(x)=\frac{(-1)^{k}}{k!} \frac{B_{k}^{(-x)}}{x}=-\sigma_{k}(-x), k \geq 0
$$

In passing, we remark that the associated sequence $\mathcal{U}_{k}(x)$ for $f(u)=\overline{u B(u)}$ is given by

$$
\sum_{k} \frac{\mathcal{U}_{k}(x)}{k!} u^{k}=e^{x u B(u)}=\sum_{i} x^{i} \frac{(u B(u))^{i}}{i!}, \quad \mathcal{U}_{k}(x)=\sum_{i=0}^{k}\binom{k}{i} B_{k-i}^{(i)} x^{i} .
$$

Now consider the Stirling polynomials convolution formula [8, (6.46)], written with $t=1$, $i \rightarrow i-m, r \rightarrow r+m$ and $s \rightarrow s+m$ :

$$
-(r+m)(s+n) \sum_{i=m}^{n} \sigma_{i-m}(r+i) \sigma_{n-i}(-s-i)=(r-s+m-n) \sigma_{n-m}(r-s)
$$

Using (8), we can write $\sigma_{n-m}(r-s), \sigma_{i-m}(r+i)$ and $\sigma_{n-i}(-s-i)$ in terms of Stirling numbers and Nörlund polynomials; after substitution in the convolution relation, we get

$$
\sum_{i=m}^{n} \frac{s(r+i, r+m)}{(r+i)^{\frac{i-m}{-}}} \frac{S(s+n, s+i)}{(s+n) \frac{n-i+1}{-}}=\frac{r-s+m-n}{s+n} \frac{B_{n-m}^{(r-s)}}{(r-s)(n-m)!}
$$

For $a=r-s$, integers $r, s \geq 0, \frac{1}{(r+i)^{\frac{i-m}{-}}}=\frac{(r+m)!}{(r+i)!}, \frac{1}{(s+n)^{n-i+1}}=\frac{(s+i-1)!}{(s+n)!}$ :

$$
\sum_{i=m}^{n} s(r+i, r+m) S(s+n, s+i) \frac{(s+i-1) \frac{i-1}{}}{(r+i)!}=\frac{a+m-n}{s+n} \frac{(s+n)!}{(r+m)!} \frac{B_{n-m}^{(a)}}{a(n-m)!}
$$

With $r=s, a=0$, we get from (8): and (9),

$$
\sum_{i=m}^{n} s(r+i, r+m) S(r+n, r+i) \frac{1}{i}=\frac{(r+n) \frac{n-m}{r+n}}{r}\left(\frac{B_{n-m}}{(n-m)!}+[m=n-1]\right), m>0
$$

which is a generalization of the case $r=s=0$, that corresponds to the known identity:

$$
\begin{equation*}
\sum_{i=m}^{n} s(i, m) S(n, i) \frac{1}{i}=\frac{1}{n}\binom{n}{m} \frac{B_{n-m}}{(n-m)!}+[m=n-1], m>0 \quad[8,(6.100)] \tag{10}
\end{equation*}
$$

The identity (10), in turn, generalizes the identity $B_{n}=\sum_{i=0}^{n}(-1)^{i} i!S(n, i) /(i+1)$ appearing in Comtet [4, p.220] and which is the special case $m=1$ of (10) and, at the same time, of Kaneko's identity $B_{n-m}=(-1)^{n-m+i} S(n-m, i) i!/(i+1)^{m} \quad[9$, Theorem 1].

Example 7. The Euler Polynomials $E_{k}^{(a)}(x)$ of order $a, a \neq 0,[12$, p.100] form the Appell sequence for $g(u)=\left(\left(e^{u}+1\right) / 2\right)^{a}$,

$$
\begin{gathered}
\sum_{k} \frac{E_{k}^{(a)}(x)}{k!} u^{k}=\left(\frac{2}{e^{u}+1}\right)^{a} e^{x u}=\left(\frac{e^{-\frac{u}{2}}}{\cosh \frac{u}{2}}\right)^{a} e^{x u}, E_{k}(x)=E_{k}^{(1)}(x): \text { Euler polynomials, } \\
\text { for } u \rightarrow 2 u, x=\frac{a}{2}: \sum_{k} \frac{2^{k} E_{k}^{(a)}\left(\frac{a}{2}\right)}{k!} u^{k}=\left(\frac{1}{\cosh u}\right)^{a}, E_{k}=2^{k} E_{k}\left(\frac{1}{2}\right): \text { Euler numbers. } \\
\operatorname{Euler}^{(a)}=\mathrm{U}=\left(\left(\frac{2}{e^{u}+1}\right)^{a}, u e^{u}\right), \quad \operatorname{Euler}^{(a)}(n, m)=\binom{n}{m} E_{n-m}^{(a)}(m), \\
C^{(a)}=\left(\left(\frac{2}{e^{u}+1}\right)^{a}, u\right), \quad C^{(a)}(n, m)=\binom{n}{m} E_{n-m}^{(a)}(0) \\
E_{k}^{(a)}(x)=\sum_{i=0}^{k} C^{(a)}(k, i) x^{i}=\sum_{i=0}^{k}\binom{k}{i} E_{k-i}^{(a)}(0) x^{i}
\end{gathered}
$$

For the Euler-array $\{e u l, E u l=(1, u E(u))\}, E(u)=1 / \cosh u$, Eul-refseq: $E_{n} / n$ !, we find

$$
\begin{aligned}
\operatorname{Eul}(n, m) & =\frac{n!}{m!}\left[u^{n-m}\right] E(u)^{m}=\binom{n}{m} 2^{n-m} E_{n-m}^{(m)}\left(\frac{m}{2}\right) \\
2^{n-m} E_{n-m}^{(m)}\left(\frac{m}{2}\right) & =\sum_{i=0}^{n-m}\binom{n-m}{i} 2^{i} m^{i} E_{i}^{(m)}(0), \quad \frac{E u l(n+1,1)}{n+1}=E_{n}=\sum_{i=0}^{n}\binom{n}{i} 2^{i} E_{i}(0) .
\end{aligned}
$$

The egf of Euler polynomials evaluated at $x=0$ and the gf $G(u)$ for the Genocchi numbers $G_{n}$ are related by

$$
\sum_{n} \frac{E_{n}(0)}{n!} u^{n}=\left(1-\tanh \frac{u}{2}\right)=\frac{2}{e^{u}+1}=\sum_{n \geq 0} \frac{G_{n+1}}{(n+1)!} u^{n}=\frac{G(u)}{u} \quad[4, \text { p.49] }
$$

thus, for the Geno-array $\{$ gen, $G e n=(1, G(u))\}$, Gen-refseq: $G_{n+1} /(n+1)$ !, we have

$$
\begin{aligned}
G e n(n, m) & =\frac{n!}{m!}\left[u^{n}\right]\left(\frac{G(u)}{u}\right)^{m}=\binom{n}{m} E_{n-m}^{(m)}(0), \quad G e n_{k}(x)=\frac{(-1)^{k}}{k!} \frac{E_{k}^{(-x)}}{x} . \\
\text { With } G(u) & =u\left(1-\tanh \frac{u}{2}\right)=u\left(1-\frac{\theta(u)}{2}\right) \text { and } \frac{\theta(u)^{i}}{i!}=\sum_{j} \theta(j, i) \frac{u^{j}}{j!}, \text { we find : } \\
\operatorname{Gen}(n, m) & =\frac{n!}{m!}\left[u^{n-m}\right] \sum_{i}\binom{m}{i} \frac{(-1)^{i}}{2^{i}} \theta(u)^{i}=\binom{n}{m} \sum_{i=0}^{n-m}\binom{m}{i} \frac{(-1)^{i} i!}{2^{i}} \theta(n-m, i) \\
& =\binom{n}{m}(-1)^{n-m}(n-m)!\sum_{i=0}^{n-m}\binom{m}{i} \frac{i}{2^{i}} \delta_{n-m-i}(n-m), \\
G e n(n+1,1) & =G_{n+1}=(-1)^{n} \sum_{i=0}^{n-m}\binom{1}{i} \frac{i}{2^{i}} \delta_{n-i}(n)=[n=0]+\frac{(-1)^{n}(n+1)!}{2} \delta_{n-1}(n) .
\end{aligned}
$$

$$
\text { With } G(u)=\frac{2 u}{e^{u}+1}=\frac{2 u\left(e^{u}-1\right)}{e^{2 u}-1}=B(2 u) S(u) \text {, we get the binomial convolution }
$$

$$
G e n(n, m)=\sum_{i=0}^{n-m}\binom{n}{i} 2^{i} B_{i}^{(m)} S(n-i, m)
$$

$$
\text { With } \frac{\operatorname{Ber}(2 u)}{2}=u \frac{2 u}{e^{2 u}-1}=\frac{u}{e^{u}-1} \frac{2 u}{e^{u}+1}=B(u) G(u), \text { we get : }
$$

$$
2^{n-m} \operatorname{Ber}(n, m)=\sum_{i=0}^{n-m}\binom{n}{i} B_{i}^{(m)} \operatorname{Gen}(n-i, m)=\binom{n}{m} \sum_{i=0}^{n-m}\binom{n-m}{i} B_{i}^{(m)} E_{n-m-i}^{(m)}(0) ;
$$

$$
\operatorname{Gen}(n+1,1)=G_{n+1}=(n+1) E_{n}(0)=\sum_{i=0}^{n}\binom{n+1}{i} 2^{i} B_{i}
$$

$$
\operatorname{Ber}(n+1,1)=(n+1) B_{n}=\frac{1}{2^{n}} \sum_{i=0}^{n}\binom{n+1}{i} B_{i} G_{n+1-i}
$$

Writing $G(2 u) / 2=2 u /\left(e^{2 u}+1\right)=e^{-u} u / \cosh u=e^{-u} E u l(u)$, and applying the binomial coefficients inversion formula, we obtain a pair of inverse relations, presumably original,

$$
\begin{aligned}
\frac{2^{n-m}}{m^{n}} G e n(n, m) & =\sum_{i}\binom{n}{i}(-1)^{n-i} \frac{\operatorname{Eul}(i, m)}{m^{i}} \leftrightarrow \frac{\operatorname{Eul}(n, m)}{m^{n}}=\sum_{i}\binom{n}{i} \frac{2^{i-m} G e n(i, m)}{m^{i}} \\
2^{n} G_{n+1} & =\sum_{i=0}^{n}\binom{n+1}{i+1}(-1)^{n-i}(i+1) E_{i} \leftrightarrow(n+1) E_{n}=\sum_{i=0}^{n}\binom{n+1}{i+1} 2^{i} G_{i+1} .
\end{aligned}
$$

Example 8. We consider the Harm1-array $\{$ har $1, \operatorname{Har} 1=(1, \operatorname{Har} 1(u))\}$ and the Harm2-array $\{\operatorname{har} 2, \operatorname{Har} 2=(1, \operatorname{Har} 2(u))\}$, where $\operatorname{Har} 1(u)$ and $\operatorname{Har} 2(u)$ are gf's related to the harmonic numbers $H_{n}$ :

$$
\begin{align*}
\sum_{k>0} H_{n} u^{n} & =\frac{-\ln (1-u)}{1-u}=\operatorname{Har} 1(u)  \tag{7.43}\\
2 \int \frac{-\ln (1-u)}{1-u} d u & =\frac{\ln ^{2}(1-u)}{u}=u\left(\frac{\ln (1-u)]}{-u}\right)^{2}=\sum_{n>0} \frac{2 H_{n}}{n+1} u^{n}=\operatorname{Har} 2(u),
\end{align*}
$$

$$
\operatorname{Har} 1(n, m)=\frac{n!}{m!}\left[u^{n-m}\right]\left(\frac{-\ln (1-u)}{u(1-u)}\right)^{m}, \operatorname{Har} 2(n, m)=\frac{n!}{m!}\left[u^{n-m}\right]\left(\frac{\ln (1-u)}{-u}\right)^{2 m}
$$

Using the inverse pair of group representations Har $1=(-) s \star(-) r$ and $(-) r=(-) S \star H a r 1$, and $\operatorname{Har} 1(n+1,1) /(n+1)!=H_{n+1}$, we get:

$$
\begin{aligned}
& \operatorname{Har} 1(n, m)=\sum_{i}(-1)^{n-i} s(n, i)\binom{i}{m} m^{i-m} \leftrightarrow\binom{n}{m} m^{n-m}=\sum_{i}(-1)^{n-i} S(n, i) \operatorname{Har} 1(i, m), \\
& (n+1)!H_{n+1}=\sum_{i=0}^{n}(-1)^{n-i} s(n+1, i+1)(i+1) \leftrightarrow n+1=\sum_{i=0}^{n}(-1)^{n-i} S(n+1, i+1)(i+1)!H_{i+1} .
\end{aligned}
$$

Similarly, with $(-) \operatorname{Har} 2=s \star \operatorname{Ber}$ and $\operatorname{Ber}=S \star(-) \operatorname{Har} 2$, and $\operatorname{Har} 2(n+1,1) /(n+1)!=$ $2 H_{n+1} /(n+2)$, we find:

$$
\begin{gather*}
(-1)^{n-m} \operatorname{Har} 2(n, m)=\sum_{i=m}^{n} s(n, i)\binom{i}{m} B_{i-m}^{(m)}=\frac{n!}{(m-1)!} 2 \sigma_{n-m}(n+m) \\
\leftrightarrow \quad\binom{n}{m} B_{n-m}^{(m)}=\sum_{i=m}^{n} S(n, i)(-1)^{i-m} \operatorname{Har} 2(i, m) \\
\frac{2 H_{n+1}}{n+2}=\frac{(-1)^{n}}{(n+1)!} \sum_{i=0}^{n} s(n+1, i+1)(i+1) B_{i}=2 \sigma_{n}(n+2),  \tag{11}\\
B_{n}=\frac{2}{n+1} \sum_{i=0}^{n} S(n+1, i+1) \frac{(-1)^{i}(i+1)!}{i+2} H_{i+1} .
\end{gather*}
$$

The identity (11) appears in [12, p.100], written in a different form. Finally:

$$
\operatorname{Har}_{k}(x)=(-1)^{k} \sum_{i=0}^{k}(x-i) \sigma_{k-i}(k-x)(-x)^{i-1}, \quad \operatorname{Har}_{k}(x)=(-1)^{k+1} 2 \sigma_{k}(k-2 x)
$$

The elements Har1 and Har2 are related to the Narumi Polynomials $\operatorname{Nar}_{k}^{(a)}(x)$ [12, p.127], forming the Sheffer sequence for $\left(g(u)=\left(u /\left(e^{u}-1\right)\right)^{a}, f(u)=e^{u}-1\right), \bar{f}(u)=\ln (1+u)$ :

$$
\begin{equation*}
\sum_{k} \frac{N a r_{k}^{(a)}(x)}{k!} u^{k}=\left(\frac{u}{\ln (1+u)}\right)^{a}(1+u)^{x} \tag{12}
\end{equation*}
$$

In fact, from (12) and the definitions of Har1 and Har2, we derive the canonical forms:

$$
\begin{aligned}
& H a r 1(n, m)=\binom{n}{m}(-1)^{n-m} N a r_{n-m}^{(-m)}(-m), \quad \operatorname{Har} 2(n, m)=\binom{n}{m}(-1)^{n-m} N a r_{n-m}^{(-2 m)}(0) \\
& \operatorname{Nar}^{(a)}=\mathrm{U}^{(a)}=\left(\left(\frac{u}{\ln (1+u)}\right)^{a}, u(1+u)\right), \quad C^{(a)}=\left(\left(\frac{u}{\ln (1+u)}\right)^{a}, \ln (1+u)\right) ; \\
& \operatorname{Nar}^{(a)}(n, m)=\binom{n}{m} N a r_{n-m}^{(a)}(m), \quad N a r_{k}^{(a)}(x)=\sum_{i=0}^{k} C(k, i) x^{i} \\
& C^{(a)}(n, m)=\frac{n!}{m!}\left[u^{n-m}\right]\left(\frac{\ln (1+u)}{u}\right)^{m-a}=(-1)^{n-m} \frac{n!}{m!}(m-a) \sigma_{n-m}(n-a) .
\end{aligned}
$$

In addition, with $u \rightarrow-u, v=-\ln (1-u)$ and $x=-a=m$, (12) yields:

$$
\begin{align*}
\frac{(-1)^{k} N a r_{k}^{(-m)}(m)}{k!} & =\left[u^{k}\right]\left(\frac{\ln (1-u)(1-u)}{-u}\right)^{m}=\left[u^{k}\right]\left(\frac{v}{e^{v}-1}\right)^{m}=\left[u^{k}\right] \sum_{i} B_{i}^{(m)} \frac{v^{i}}{i!} \\
& =\sum_{i=1}^{k} \frac{(-1)^{k-i}}{k!} B_{i}^{(m)} s(k, i) \tag{13}
\end{align*}
$$

when $m=1, \sum_{i=1}^{k}(-1)^{k-i} s(k, i) B_{i}=\left[\frac{u^{k}}{k!}\right] \frac{\ln (1-u)(1-u)}{-u}=k!\left(\frac{1}{k+1}-\frac{1}{k}\right)=\frac{-(k-1)!}{k+1}$,
that is an identity which appears in Wilf [17, (4.3.21)].
Consider the $\underline{\mathcal{T} \text { au-array }}\{\tau, \mathcal{T}\}, \quad \tau=s \star(-) r, \quad \tau(u)=-r(-s(u))=(1+u) \ln (1+u)$ :

$$
\begin{aligned}
\tau(n, m) & =\operatorname{Nar}^{(-m)}(n, m)=\binom{n}{m} N a r_{n-m}^{(-m)}(m)=\sum_{i=m}^{n} s(n, i)\binom{i}{i-m} m^{i-m} \\
\mathcal{T}(n, m) & =(-1)^{n-m} \widetilde{\tau}(n, m)=\sum_{i=m}^{n} S(i, m)\binom{n-1}{n-i} n^{n-i}
\end{aligned}
$$

The numbers $\tau(n, m)$ are denoted $b(n, m)$ in Comtet [4, pp. 139-140], wherein they are used in the computation of the $n$-th derivative of $x^{a x}, x>0, a$ real $\neq 0$. For completeness, we also mention the group representation $\tau=(2) \lambda \star \operatorname{Har} 1$.

## 5 Concluding remarks

In this paper we obtained several known or original identities between sequences by setting $m=1$ in identities between generalized numbers, for example, (11). Conversely, we found identities between generalized numbers, extending identities between numerical sequences like, for instance, (13) which is an original generalization of Wilf's identity [17, (4.3.21)]. The Akiyama-Tanigawa algorithm and the Euler-Seidel construction are also based on extensions
of numerical sequences, but the matrices have properties different from those of Riordan matrices and, at any rate, the purpose there is to develop efficient methods for calculating special sequences. The interested reader may consult the literature on the subject, for instance, $[6,11,3,7]$, in order to compare the various approaches.

Canonical forms implied Corollary 2, readily proving the existence of extensions $\rho(x, x-$ $k$ ), that are of polynomial type when $\rho$ has weight $c=1$, and they established a connection with the family of "orthogonal" polynomials, but some care should be exercised because certain "orthogonal" polynomials may have different names, for instance, Mittag-Leffler polynomials and Meixner polynomials of the second kind $M(x ; 0,0)$ [12, p. 126] coincide, similarly, Bernoulli polynomials of the second kind $b_{k}(x)$ [12, p. 113] and Narumi polynomials $\operatorname{Nar}_{k}^{(-1)}(x)$ are the same. Recall also that, applying Proposition (3), we easily obtained the formula (5) for $L_{k}^{(\alpha)}(x)$ and (7) for $M_{k}(x)$, which are found in [12, p. 109 and p. 76] after longer algebraic manipulations (and a printing error in the last expression of $M_{k}(x)$ ).

Finally, we remember that transformation rules greatly simplified algebraic manipulations, and that the duality law played an important role in the computation of inverse numbers, especially when one of the two gf's: $f(u), \bar{f}(u)$, was not available in closed form.

## 6 Acknowledgement

The author wishes to thank an anonymous referee for their careful reading of this paper and their constructive suggestions.
