0. Introduction. In 1985, while studying the solutions of the quantum Yang-Baxter equation, Drinfeld [D1] and Jimbo [J1] independently discovered a fundamental algebraic object known as a quantized universal enveloping algebra or quantum group $U_q(\mathfrak{g})$ associated with a symmetrizable Kac-Moody Lie algebra $\mathfrak{g}$ which may be thought of as a $q$-analogue or $q$-deformation of the universal enveloping algebra of $\mathfrak{g}$. The quantized universal enveloping algebra has a Hopf algebra structure and thus allows the tensor product structure on their representations. The quantized universal enveloping algebra associated with an affine Lie algebra is also known as a quantum affine Lie algebra. In [L.] (also see [R]), it has been shown that for generic $q$ (i.e., $q$ is not a root of unity) the integrable representations of a Kac-Moody Lie algebra can be deformed consistently to those of the corresponding quantized universal enveloping algebra. In particular, the internal structure of the integrable highest-weight representations of an affine Lie algebra is essentially the same as that of the corresponding quantum affine Lie algebra. However, working in the larger context of a quantum affine Lie algebra, it often becomes easier to extract more informations about the representations of the corresponding affine Lie algebra by using the power of abstraction in representation theory.

The eminent role of the quantized universal enveloping algebras in two-dimensional solvable lattice models is widely known. The $R$-matrices, which are the intertwiners of tensor product representations, give the Boltzmann weights of the lattice models with commuting transfer matrices ([J2]). The quantum parameter $q$
corresponds to temperature in the lattice model. In particular, \( q = 0 \) corresponds to the absolute temperature zero in the lattice model. So one can expect that the quantized universal enveloping algebra has a simpler structure in that case. Motivated by this, Kashiwara introduced the notion of crystal base and proved the existence and uniqueness of this base for all integrable representation of \( U_q(\mathfrak{g}) \), where \( \mathfrak{g} \) is any symmetrizable Kac-Moody Lie algebra ([K1–K4]).

We first recall the basic concepts of crystal base theory. A crystal is a set \( B \) endowed with the maps \( \tilde{e}_i, \tilde{f}_i: B \sqcup \{0\} \to B \sqcup \{0\} \) \((i \in I)\) which satisfy (i) \( \tilde{e}_i 0 = \tilde{f}_i 0 = 0 \), (ii) for any \( b \) and \( i \), there is \( n > 0 \) such that \( \tilde{e}_i^n b = \tilde{f}_i^n b = 0 \), (iii) for \( b, b' \in B \) and \( i \in I \), \( b' = \tilde{f}_i b \) if and only if \( b = \tilde{e}_i b' \). A crystal may be regarded as a colored (by \( I \)) oriented graph (also known as a crystal graph) by defining arrows for \( b, b' \in B, b \rightarrow b' \) if and only if \( b' = \tilde{f}_i b \). For an element \( b \) of a crystal \( B \), we set \( e_i(b) = \max \{ n \geq 0 | \tilde{e}_i^n b \in B \} \) and \( \varphi_i(b) = \max \{ n \geq 0 | \tilde{f}_i^n b \in B \} \). Let \( \mathcal{P} \) be a weight lattice. A crystal \( B \) is called a \( \mathcal{P} \)-weighted crystal if it has a decomposition \( B = \bigsqcup_{\lambda \in \mathcal{P}} B_\lambda \) such that \( \tilde{e}_i B_\lambda \subset B_{\lambda + \varepsilon_i} \sqcup \{0\}, \tilde{f}_i B_\lambda \subset B_{\lambda - \varepsilon_i} \sqcup \{0\} \), and for any \( i \in I \) and \( b \in B_\lambda \) the equality \( \varphi_i(b) - e_i(b) = \langle h_i, \lambda \rangle \) holds.

Let \( B_1 \) and \( B_2 \) be two crystals. A morphism \( \phi: B_1 \to B_2 \) of crystals is defined to be a map \( \phi \) from \( B_1 \) to \( B_2 \) that commutes with the action of \( \tilde{e}_i \) and \( \tilde{f}_i \). Here we understand \( \phi(0) = 0 \). Then the crystals and their morphisms form a category. For two crystals \( B_1 \) and \( B_2 \), we define their tensor product as follows. The underlying set is \( B_1 \times B_2 \). We write \( b_1 \otimes b_2 \) for \( (b_1, b_2) \). We understand \( b_1 \otimes 0 = 0 \otimes b_2 = 0 \). The actions of \( \tilde{e}_i \) and \( \tilde{f}_i \) are given by

\[
\tilde{f}_i(b_1 \otimes b_2) = \tilde{f}_i b_1 \otimes b_2 \quad \text{if} \quad \varphi_i(b_1) > e_i(b_2) \\
= b_1 \otimes \tilde{f}_i b_2 \quad \text{if} \quad \varphi_i(b_1) \leq e_i(b_2)
\]

\[
\tilde{e}_i(b_1 \otimes b_2) = \tilde{e}_i b_1 \otimes b_2 \quad \text{if} \quad \varphi_i(b_1) \geq e_i(b_2) \\
= b_1 \otimes \tilde{e}_i b_2 \quad \text{if} \quad \varphi_i(b_1) < e_i(b_2).
\]

Then \( B_1 \otimes B_2 \) is a crystal, and the category of crystals is endowed with the structure of tensor category. If both \( B_1 \) and \( B_2 \) are \( \mathcal{P} \)-weighted crystals, then so is \( B_1 \otimes B_2 \).

Let \( \mathcal{M} \) be an integrable \( U_q(\mathfrak{g}) \)-module. Then we have \( \mathcal{M} = \bigoplus_{\lambda \in \mathcal{P}} M_\lambda \), with \( \dim M_\lambda < \infty \). For each \( i \in I \), any weight vector \( u \in M_\lambda \) can be written uniquely as \( u = \sum f_i^{(n)} u_n \), where \( u_n \in M_{\lambda + n\varepsilon_i} \cap \ker e_i \) and \( n \) ranges over integers such that \( n \geq 0 \) and \( \langle h_i, \lambda \rangle + n > 0 \). Define the endomorphisms \( \tilde{e}_i \) and \( \tilde{f}_i \) by

\[
\tilde{e}_i u = \sum f_i^{(n-1)} u_n, \quad \tilde{f}_i u = \sum f_i^{(n+1)} u_n.
\]

Let \( \mathcal{A} \) be the subring of \( \mathbb{Q}(q) \) consisting of \( f \in \mathbb{Q}(q) \) that is regular at \( q = 0 \).

A crystal lattice \( L \) of an integrable \( U_q(\mathfrak{g}) \)-module \( M \) is a free \( \mathcal{A} \)-submodule of \( M \) such that \( M \cong \mathbb{Q}(q) \otimes_{\mathcal{A}} L \). \( L = \bigoplus_{\lambda \in \mathcal{P}} L_\lambda \) where \( L_\lambda = L \cap M_\lambda \), and \( \tilde{e}_i L \subset L, \tilde{f}_i L \subset L \). A crystal base of the integrable \( U_q(\mathfrak{g}) \)-module \( M \) is a pair \((L, B)\) such that (i) \( L \) is a crystal lattice of \( M \), (ii) \( B \) is a \( \mathcal{Q} \)-base of \( L/qL \), (iii) \( B = \bigcup_{\lambda \in \mathcal{P}} B_\lambda \) where \( B_\lambda = \)
$B \cap (L_{+}/qL_{+})$, (iv) $\tilde{e}_i B \subset B \sqcup \{0\}$, $\tilde{f}_i B \subset B \sqcup \{0\}$, and (v) for $b, b' \in B$, $b' = \tilde{f}_i b$ if and only if $b = \tilde{e}_i b'$ for $i \in I$. We sometimes replace condition (ii) by: $B_{ps} = B' \sqcup (-B')$ where $B'$ is a $Q$-base of $L/qL$. We call $(L, B_{ps})$ a crystal pseudobase and $B_{ps}/\{\pm 1\}$ the associated crystal of $(L, B_{ps})$.

Let $P^+$ be a set of dominant integral weights and $V(\Lambda)$ be an irreducible integrable highest-weight $U_q(g)$-module with highest weight $\Lambda \in P^+$ and highest-weight vector $v_\Lambda$. Define $L(\Lambda)$ to be the smallest $A$-module containing $v_\Lambda$ and stable under $\tilde{f}_i$'s. Set $B(\Lambda) = \{b \in L(\Lambda)/qL(\Lambda)| b = \tilde{f}_1^m \tilde{f}_2 \cdots \tilde{f}_n v_\Lambda \text{ mod } qL(\Lambda)\} \setminus \{0\}$. Then the pair $(L(\Lambda), B(\Lambda))$ is a crystal base for $V(\Lambda)$ ([K2]). A crystal is called a crystal with highest weight if it is isomorphic to $B(\Lambda)$ for some $\Lambda \in P^+$.

The theory of crystal base provides a remarkably powerful combinatorial tool to study the internal structure of the integrable highest-weight representations of symmetrizable Kac-Moody Lie algebra. In [MM], using the Fock-space representations of $U_q(\widehat{sl}(n))$, Misra and Miwa gave an explicit description of the crystal base for the level-one representations of the quantum affine Lie algebra $U_q(\widehat{sl}(n))$ in terms of certain infinite Young diagrams which are parametrized by certain paths that arise naturally in solvable lattice models. In [JMMO], this result was generalized to integrable highest-weight representations of arbitrary level for $U_q(\widehat{sl}(n))$. In [KN], Kashiwara and Nakashima gave an explicit combinatorial description of crystal bases of finite-dimensional irreducible representations of $U_q(g)$, where $g$ is a finite-dimensional classical simple Lie algebras of $A, B, C, D$ type.

Recently, we have developed the theory of affine crystals which has enabled us to study the integrable highest-weight representations of arbitrary level for any quantum affine Lie algebra $U_q(g)$ ([KMN2]). We briefly summarize the main results of [KMN2]. From now on, we will assume $g$ to be an indecomposable affine Lie algebra over $Q$ generated by $\{e_i, f_i | i \in I\}$ ($I = \{0, 1, \ldots, n\}$) and the Cartan subalgebra $t$. Note that $\dim t = n + 2$ and $g$ has a one-dimensional center spanned by the canonical central element $c$. Recall that $\{x_i | i \in I\} \subset t^*$ denotes the set of simple roots, and $\{h_i | i \in I\} \subset t$ the set of simple coroots. Also $P$ (resp. $Q$) denotes the weight (resp. root) lattice. Let $\delta \in Q^+$ be the generator of null roots (see [Kac]). Set $t_{cl} = \bigoplus_{i \in I} Q h_i \subset t$ and $t_{cl}^* = (\bigoplus_{i \in I} Q h_i \subset t)^*$. Let $cl: t^* \rightarrow t_{cl}^*$ denote the canonical morphism. We have an exact sequence

$$0 \rightarrow Q\delta \rightarrow t^* \rightarrow t_{cl}^* \rightarrow 0.$$

Then $\dim t_{cl}^* = n + 1$ and $\{\lambda \in t_{cl}^* | \lambda(\delta) = 0\} = \sum_{i \in I} Q c l(h_i)$. Note that $\delta - \alpha_0 \in \sum_{i=1}^n Z \alpha_i$. We define a map $af: t_{cl}^* \rightarrow t^*$ satisfying: $cl \circ af = id$ and $af \circ cl(h_i) = \alpha_i$ for $i \neq 0$. Observe that for $i \in I$ the fundamental weight $\Lambda_i \in af(t_{cl}^*) \subset t^*$ and the weight lattice $P = \sum_{i=1}^n Z \Lambda_i + Z \delta \subset t^*$. We set $P_{cl} = cl(P) = \sum_{i \in I} Z c l(\Lambda_i) \subset t_{cl}^*$. We call an element of $P_{cl}$ a classical weight and an element of $P$ an affine weight. Note that $af \circ cl(\Lambda) = \Lambda_i$. Recall that the quantum affine Lie algebra $U_q(g)$ is a $Q(q)$-algebra generated by $\{e_i, f_i | i \in I\} \cup \{q^h | h \in P^+\}$. Let $U'_q(g)$ be a $Q(q)$-algebra generated by $\{e_i, f_i | i \in I\} \cup \{q^h | h \in P_{cl}^+\}$. Then $U_q(g)$ is also a quantized universal enveloping alge-
bra with $P_d$ as the weight lattice. A $P_d$-weighted crystal is called a classical crystal and a $P$-weighted crystal is called an affine crystal.

Let $B$ be a classical crystal. For $b \in B$, we set $\varepsilon(b) = \sum \varepsilon_i(b)\Lambda_i$ and $\varphi(b) = \sum \varphi_i(b)\Lambda_i$. Note that $wt(b) = cl(\varphi(b) - \varepsilon(b))$. A $\mathbb{Z}$-valued function $H$ on $B \otimes B$ is called an energy function on $B$ if, for any $i \in I$ and $b \otimes b' \in B \otimes B$ such that $\varepsilon_i(b \otimes b') \neq 0$, we have

$$H(\varepsilon_i(b \otimes b')) = H(b \otimes b')$$

if $i \neq 0$,

$$= H(b \otimes b') + 1$$

if $i = 0$ and $\varphi_0(b) \geq \varepsilon_0(b')$,

$$= H(b \otimes b') - 1$$

if $i = 0$ and $\varphi_0(b) < \varepsilon_0(b')$.

For a subset $J$ of $I$, we denote by $U_q(g_J)$ the $\mathbb{Q}(q)$-algebra generated by $\{e_k, f_k | k \in J \} \cup \{q^h | h \in P_d^+\}$. We call a classical crystal virtual if, for any $i, j \in I$, regarded as an $(i, j)$-crystal, $B$ is a disjoint union of the crystals of finite-dimensional integrable $U_q(g_{(i,j)})$-modules. Let $\text{Mod}^{ij}(g, P_d)$ be the category of finite-dimensional $U_q^i(g)$-modules which have weight decompositions with weights in $P_d$. Let $B$ be an associated crystal of a crystal pseudobase of an object of $\text{Mod}^{ij}(g, P_d)$. Then $\langle c, \varepsilon(b) \rangle = \langle c, \varphi(b) \rangle$ for any element $b \in B$. Set $P_d^{+} = \sum \mathbb{Z}\Lambda_i$ and $(P_d^+)_l = \{\lambda \in P_d^+ | \langle \lambda(c) = l \}$ for $l \in \mathbb{Z}$. A classical crystal $B$ is a perfect crystal of level $l$ if $B$ satisfies:

(i) $B \otimes B$ is connected;

(ii) there exists $\lambda_0 \in P_d$ such that $wt(B) \subseteq \lambda_0 + \sum_{i \neq 0} \mathbb{Z} a_i$ and $\#(B_{\lambda_0}) = 1$;

(iii) there is an object of $\text{Mod}^{ij}(g, P_d)$ with a crystal pseudobase of which $B$ is an associated crystal;

(iv) for any $b \in B$, we have $\langle c, \varepsilon(b) \rangle \geq l$;

(v) the maps $\varepsilon$ and $\varphi$ from $B_l = \{b | \langle c, \varepsilon(b) \rangle = l \}$ to $(P_d^+)_l$ are bijective.

Let $B(\Lambda)$ be the crystal with dominant integral highest weight $\Lambda$ and denote by $u_\Lambda$ the highest-weight element of $B(\Lambda)$. Let $B$ be a perfect crystal of level $l$ with an energy function $H$ and let $\Lambda \in (P_d^+)_l$ be a dominant integral weight of level $l$. In [KMN2], we proved the isomorphism of classical crystals

$$B(\Lambda) \otimes B \cong B(\Lambda + wt(b_0)),$$

where $b_0$ is the unique element in $B$ such that $\varepsilon(b_0) = \Lambda$.

For $\Lambda \in (P_d^+)_l$, let $b(\Lambda)$ be the unique element of $B$ such that $\varphi(b(\Lambda)) = \Lambda$. Then by the above isomorphism, we have an isomorphism of classical crystals

$$B(\Lambda) \cong B(\varepsilon(b(\Lambda))) \otimes B.$$ We define the sequence $(b_k)_{k \geq 1}$ and $(\lambda_k)_{k \geq 1}$ inductively as follows: let $b_1 = b(\Lambda)$, $\lambda_1 = \varepsilon(b(\Lambda))$. For $k \geq 2$, define $b_k = b(b_{k-1})$, $\lambda_k = \varepsilon(b_k)$. Then by repeating the above procedure, we obtain an isomorphism of classical crystals

$$\psi_k : B(\Lambda) \cong B(\lambda_k) \otimes B^{\otimes k}.$$
given by $u_{\Lambda} \mapsto u_{\Lambda_k} \otimes b_k \otimes \cdots \otimes b_1$. Moreover, it can be shown that, for any $b \in B(\Lambda)$, there exists $k > 0$ such that $\psi_k(b) \in u_{\Lambda_k} \otimes B^{\otimes k}$. The sequence $(b_1, b_2, \ldots)$ is called the ground-state path of weight $\Lambda$. A $\Lambda$-path in $B$ is, by definition, a sequence $p = (p(n))_{n \geq 1}$ in $B$ such that $p(n) = b_n$ for all $n > 0$. Let $\mathcal{P}(\Lambda, B)$ denote the set of $\Lambda$-paths. Then we have the following realization of the crystal $B(\Lambda)$ as the set $\mathcal{P}(\Lambda, B)$ of $\Lambda$-paths:

$B(\Lambda)$ is isomorphic to $\mathcal{P}(\Lambda, B)$ by $B(\Lambda) \ni b \mapsto p \in \mathcal{P}(\Lambda, B)$ where $\psi_k(b) = u_{\Lambda_k} \otimes p(k) \otimes \cdots \otimes p(1)$ for $k \gg 0$.

The weight of a path $p = (p(n))_{n \geq 1}$ in $B$ is given by the formula

$$wt(p) = \Lambda + \sum_{k=1}^{\infty} (af(wtp(k)) - af(wtb_k))$$

$$- \left( \sum_{k=1}^{\infty} k(H(p(k+1) \otimes p(k)) - H(b_{k+1} \otimes b_k)) \right) \delta.$$

Hence we have

$$ch V(\Lambda) = \sum_{\mu \in \mathfrak{h}^*} \dim V(\Lambda)_\mu e^\mu = \sum_{p \in \mathcal{P}(\Lambda, B)} e^{wt(p)}.$$

The one-point functions are the basic macroscopic quantities that describe the multiphase structure of a given lattice model of statistical mechanics. For the two-dimensional solvable lattice models, a method of computing the one-point functions is known as the corner transfer matrix method ([B]), which reduces the two-dimensional statistical sums of the one-point functions to the one-dimensional statistical sums over certain paths ([ABF]). To apply Baxter’s corner transfer matrix method, it is required that the second inversion relations hold. Suppose that a $U_q(\mathfrak{g})$-module $V$ has a crystal pseudobase and its associated crystal $B$ is perfect of level $l$. In [KMN], we showed that the second inversion relations hold for $V$. Thus for $a \in P_\alpha$ and $\Lambda \in (P_\alpha)^{\otimes 1}$, the one-point function $P(a|\Lambda)$ can be written in the form

$$P(a|\Lambda) = \frac{G(a)}{Z},$$

where

$$G(a) = q^{-4\langle \Lambda - af(a) \rangle} \sum_{p \in \mathcal{P}(\Lambda, B)(a)} q^{4\langle \rho, \delta \rangle \eta(p)},$$

$$\mathcal{P}(\Lambda, B)(a) = \{(p(k))_{k=1}^{\infty} \in \mathcal{P}(\Lambda, B)| a + \sum_{i=1}^{k} wt p(i) = \sum_{i=1}^{k} wt b_i \text{ for } k \gg 0\}.$$
\[ \omega(p) = \sum_{k=1}^{\infty} k(H(p(K + 1) \otimes p(k)) - H(b_{k+1} \otimes b_k)), \]

\[ Z = \sum_{a \in \mathcal{P}_L} G(a). \]

Here \((b_k)_{k=1}^{\infty}\) is the ground-state path of weight \(\Lambda\). Let \(V(\Lambda)\) be the irreducible highest-weight module over \(U_q(\mathfrak{g})\) with highest weight \(\Lambda\). Using the realization of the crystal base \(B(\Lambda)\) as the set \(\mathcal{P}(\Lambda, B)\) of \(\Lambda\)-paths, we obtain the closed expression of the one-point function \(P(a|\Lambda)\) in terms of string functions for \(U_q(\mathfrak{g})\):

\[ P(a|\Lambda) = \frac{\sum_{\lambda} \dim V(\Lambda)_{\lambda a - \lambda b} q^{-4(\rho, \lambda a - \lambda b)}}{\sum_{\mu \in w(\Lambda)} \dim V(\Lambda)_\mu q^{-4(\rho, \mu)}}, \]

where \(\lambda_a = \Lambda - a \sigma(\Lambda)\).

As we have seen so far, the perfect crystals play a crucial role in realizing the crystal bases of integrable irreducible representations of quantum affine Lie algebras and in computing the one-point functions of vertex models. In this paper, we undertake an extensive study of perfect crystals for quantum affine Lie algebras. Let \(U_q(\mathfrak{g})\) be a quantum affine Lie algebra of type \(A_n^{(1)}, B_n^{(1)}, C_n^{(1)}, D_n^{(1)}, A_{2n}^{(2)}, A_{2n-1}^{(2)}, \) or \(D_{n+1}^{(2)}\). For a given level \(l\), we construct a finite-dimensional irreducible representation \(V_l\) of \(U_q(\mathfrak{g})\) with a crystal pseudobase such that its associated crystal is perfect of level \(l\). The main idea of the construction can be explained as follows.

We first start with a suitable crystal \(B\) for \(U_q(\mathfrak{g}_{I \setminus \{0\}})\) whose internal structure is explicitly described in [KN]. We define the 0-arrows in such a way that \(B\) becomes a virtual crystal for \(U_q(\mathfrak{g})\) and prove in a purely combinatorial way that \(B\) is a perfect crystal of level \(l\).

On the other hand, let \(V\) be a certain finite-dimensional module over \(U_q(\mathfrak{g}_{I \setminus \{0\}})\) with a crystal base which is characterized by a polarization on \(V\). Let us denote by \(B_I\) the associated crystal. The explicit description of \(B_I\) is given in [KN]. We define the actions of \(e_0\), \(f_0\), and \(q^{\mathfrak{h}0}\) on \(V\) to make it an irreducible module for \(U_q(\mathfrak{g})\) and verify that the polarization on \(V\) for \(U_q(\mathfrak{g}_{I \setminus \{0\}})\) is also a polarization for \(U_q(\mathfrak{g})\). The action of \(f_0\) induces the 0-arrows on \(B_I\) extending it to a crystal for \(U_q(\mathfrak{g})\). We show that \(B_I\) is a perfect crystal of level 1. Using the global base ([K4]), we compute the \(R\)-matrix for \(V\) explicitly, and by the fusion construction we obtain a certain finite-dimensional submodule \(V_I\) of \(V \otimes I\) for \(U_q(\mathfrak{g})\). The polarization on \(V\) for \(U_q(\mathfrak{g})\) induces a polarization on \(V_I\). Our results on polarization show that \(V_I\) has a crystal pseudobase and that its associated crystal is isomorphic to \(B\) as crystals for \(U_q(\mathfrak{g}_{I \setminus \{0\}})\) for some subsets \(J\) of \(I\). Now we prove that these isomorphisms can be uniquely extended to that of crystals for \(U_q(\mathfrak{g})\) and thus conclude that \(V_I\) has a crystal pseudobase whose associated crystal is perfect of level \(l\). The fundamental results on polarization and fusion construction used here are developed in Sections 2 and 3.

We illustrate our construction for the case of \(U_q(C_2^{(1)})\) of level 2 in Figure 1. Let \(U_q(\mathfrak{g})\) be the quantum affine Lie algebra of type \(C_2^{(1)}\) and let \(I = \{0, 1, 2\}\) be the index.
set of simple roots for $U_q(\mathfrak{g})$. We start with the crystal $B = B(2\Lambda_2)$ of the finite-dimensional irreducible representation $V(2\Lambda_2)$ with highest weight $2\Lambda_2$ for $U_q(\mathfrak{g}_2)$. The crystal graph structure of $B$ is given in [KN]. We define the 0-arrows on $B$ as shown in Figure 2. Then it is easy to verify that $B$ is a virtual crystal for $U'_q(\mathfrak{g})$. By letting $\lambda_0 = 2(\Lambda_2 - \Lambda_0)$, we show that $B$ is perfect and of level 2. By [KN], we have $B \cong B(2(\Lambda_2 - \Lambda_0))$ as crystals for $U_q(g_{1,2})$ and $B \cong B(2(\Lambda_0 - \Lambda_1))$ as crystals for $U_q(g_{1,1})$.

On the other hand, let $V = V(\Lambda_2)$ be the finite-dimensional irreducible representation of $U_q(\mathfrak{g}_2)$ with highest weight $\Lambda_2$, as shown in Figure 3. It has a crystal base, and the structure of the associated crystal $B_1 = B(\Lambda_2)$ is given in [KN]. Since the dimension of each weight space is one, we may identify the elements of the global
base for $V(\Lambda_2)$ with those of the crystal base. So we will use the same symbol for the global base as for the crystal base. We define the actions of $e_0$ and $f_0$ by

\[
e_0 \begin{array}{c} 1 \\ 2 \end{array} = \begin{array}{c} 2 \\ 1 \end{array}, \quad e_0 \begin{array}{c} 1 \\ 2 \end{array} = \begin{array}{c} 2 \\ 1 \end{array}, \quad \text{and if } u \neq \begin{array}{c} 1 \\ 2 \\ 1 \end{array}, \text{ then } e_0 u = 0;
\]
The action of $q^h_0$ is given by the relation $q^h_0 = q^{-h_1-h_2}$. It is straightforward to verify that $V$ is a well-defined module for $U_q'(g)$ with the actions given above. Let $(\ , \ )$ be the polarization on the $U_q(C_2)$-module $V$. Then one can directly check that it is also a polarization for the $U_q'(g)$-module $V$. The action of $f_0$ defines the 0-arrows on $B_1$ making it a crystal for $U_q'(g)$, as shown in Figure 4.

With $\lambda_0 = \Lambda_2 - \Lambda_0$, it is easy to check that $B_1$ is a perfect crystal of level 1.

Let us denote by $V_x$ the $U_q'(g)$-module $\mathbb{Q}[x, x^{-1}] \otimes V$ with the actions of $e_i, f_i$, and $t_i$ given by $x^{\delta_i} e_i, x^{-\delta_i} f_i$, and $t_i$, respectively. Then there is a $U_q'(g)$-linear map $R(x, y): V_x \otimes V_y \to V_y \otimes V_x$ satisfying the Yang-Baxter equation. The map $R(x, y)$ depends only on the ratio $x/y$, and is called the $R$-matrix for $V$. As a $U_q(C_2)$-module, we have

$$V(\Lambda_2) \otimes V(\Lambda_2) \cong V(2\Lambda_2) \oplus V(2\Lambda_1) \oplus V(0).$$

Let $z = xy^{-1}$. Then up to a multiple of an element of $\mathbb{Q}(q)(z)$, the $R$-matrix $R(x, y) = R(z)$ can be computed explicitly:

$$R(z) = (1 - q^4 z)(1 - q^6 z)P_{2\Lambda_2} + (z - q^4)(1 - q^4 z)P_{2\Lambda_1} + (z - q^4)(z - q^6)P_0,$$

where $P_{2\Lambda_2}, P_{2\Lambda_1},$ and $P_0$ are the projections of $V(\Lambda_2) \otimes V(\Lambda_2)$ onto $V(2\Lambda_2), V(2\Lambda_1),$ and $V(0)$, respectively. We take the $U_q'(g)$-module $V_2$ to be the image of $V_{q^2} \otimes V_{q^{-2}}$ under $R(q^4, q^{-2}) = R(q^4)$ in $V_{q^2} \otimes V_{q^{-2}}$. Since $R(q^4) = (1 - q^8)(1 - q^{10})P_{2\Lambda_2}$, as a $U_q(g(1, 2))$-module, $V_2$ is isomorphic to $V(2(\Lambda_2 - \Lambda_0))$. Since the Weyl group of $C_2$ contains $-1$, it can be shown that $V_2$ is isomorphic to $V(2(\Lambda_0 - \Lambda_2))$ as a $U_q(g(0, 1))$-
module. The polarization on $V$ induces a polarization on $V_2$, and our results on the polarization show that $V_2$ admits a crystal pseudobase. Hence by the above observation, its crystal $B_2$ is isomorphic to $B(2(\Lambda_2 - \Lambda_0))$ as a crystal for $U_q(\mathfrak{g}_{(1,2)})$ and is isomorphic to $B(2(\Lambda_0 - \Lambda_2))$ as a crystal for $U_q(\mathfrak{g}_{(0,1)})$. Thus we have two isomorphisms $\psi_0: B \rightarrow B_2$ as crystals for $U_q(\mathfrak{g}_{(1,2)})$ and $\psi_2: B \rightarrow B_2$ as crystals for $U_q(\mathfrak{g}_{(0,1)})$. Then both $\psi_0$ and $\psi_2$ are isomorphisms of $B$ onto $B_2$ regarded as crystals for $U_q(\mathfrak{g}_{(1)})$. As a crystal for $U_q(\mathfrak{g}_{(1)})$, $B$ splits into a direct sum of crystals with highest weight for $U_q(\mathfrak{g}_{(1)})$:

$$B \cong B(2\Lambda_2 - 2\Lambda_0) \oplus B(2\Lambda_1 - 2\Lambda_0) \oplus B(-2\Lambda_0 + 4\Lambda_1 - 2\Lambda_2)$$

$$\oplus B(2\Lambda_1 - 2\Lambda_2) \oplus B(2\Lambda_0 - 2\Lambda_2).$$

Since the highest weights for $U_q(\mathfrak{g}_{(1)})$ are all distinct, $\psi_0$ and $\psi_2$ must coincide for highest weight elements for $U_q(\mathfrak{g}_{(1)})$, and hence for all the elements of $B$, which defines a unique isomorphism of $B$ onto $B_2$ as crystals for $U_q(\mathfrak{g})$. Thus we conclude that $V_2$ has a crystal pseudobase whose associated crystal is perfect of level 2.

1. Results. In this section, we summarize the results of this article, which give explicit forms of perfect crystals of an arbitrary level for $\mathfrak{g} = A^{(1)}_n, B^{(1)}_n, C^{(1)}_n, D^{(1)}_n,$ $A^{(2)}_{2n}, A^{(2)}_{2n+1}$, and $D^{(2)}_{n+1}$.

1.1. Perfect crystal (see [KMN$^2$]). We assume that the rank of $\mathfrak{g}$ is greater than 2. We set $P_\lambda^+ = \{ \lambda \in P_\lambda \mid \langle h_i, \lambda \rangle \geq 0 \text{ for any } i \}$ $\cong \sum Z_{\geq 0} \Lambda_i$ and $(P_\lambda^+)_l = \{ \lambda \in P_\lambda^+ \mid \langle c, \lambda \rangle = l \} \cong \{ \lambda \in \sum Z\Lambda_i \mid \langle c, \lambda \rangle = l \}$ for $l \in Z_{\geq 0}$.

Let $B$ be a classical crystal. For $b \in B$, we set $e(b) = \sum \varepsilon_i(b) \Lambda_i$ and $\varphi(b) = \sum \varphi_i(b) \Lambda_i$. Note that $w_t(b) = c l(\varphi(b) - e(b))$.

Definition 1.1.1. For $l \in Z_{\geq 0}$, we say that $B$ is a perfect crystal of level $l$ if $B$ satisfies the following conditions.

(1.1.1) $B \otimes B$ is connected.

(1.1.2) There exists $\lambda_0 \in P_\lambda$ such that $w_t(B) \subset \lambda_0 + \sum_{i \neq 0} Z_{\leq 0} \alpha_i$ and that $\#(B_{\lambda_0}) = 1$.

(1.1.3) There is a $U_q(\mathfrak{g})$-module in $\text{Mod}^f(\mathfrak{g}, P_\lambda)$ with a crystal pseudobase $(L, B')$ such that $B$ is isomorphic to $B'/\{ \pm 1 \}$.

(1.1.4) For any $b \in B$, we have $\langle c, \varepsilon(b) \rangle \geq l$.

(1.1.5) The maps $e$ and $\varphi$ from $B_l = \{ b \mid \langle c, e(b) \rangle = l \}$ to $(P_\lambda^+)_l$ are bijective.

We call an element of $B_l$ minimal.

Let $B$ be a perfect crystal of level $l$. For $\lambda \in (P_\lambda^+)_l$, let $b(\lambda) \in B$ be the element such that $\varphi(b(\lambda)) = \lambda$. Let $\sigma$ be the automorphism of $(P_\lambda^+)_l$ given by $\sigma \lambda = \varepsilon(b(\lambda))$. Then the conditions (4.5.1) and (4.5.2) in [KMN$^2$] are satisfied by taking $b_\lambda = b(\sigma^{n-1} \lambda)$ and $\lambda_\lambda = \sigma^{n-1} \lambda$. Hence by Theorem 4.5.2 in [KMN$^2$] we have the following result.

Proposition 1.1.2 ([KMN$^2$]). For $\lambda \in (P_\lambda^+)_l$, let $\mathcal{P}(\lambda, B)$ be the set of sequences $\{p(n)\}_{n \geq 1}$ in $B$ such that $p(n) = b(\sigma^{n-1} \lambda)$ for $n > 0$. Then $B(\lambda)$ is isomorphic to $\mathcal{P}(\lambda, B)$ by $B(\lambda) \ni b \mapsto \otimes_{\lambda} b(\sigma^{n-1} \lambda) \otimes p(k) \otimes \cdots \otimes p(1)$ for $k > 0$. 
1.2. $(A_n^{(1)}, B(l\Lambda_k))$ \hspace{1em} $(n \geq 2, 1 \leq k \leq n)$. Let $I = \mathbb{Z}/(n + 1)\mathbb{Z}$ be the index set of the simple roots for the affine quantized enveloping algebra of type $A_n^{(1)}$ and let $J = \{1, \ldots, n\}$ be that of type $A_n$. For $i \in I$ we define $i^{(0)}: J \to I$ by $i^{(0)}(j) = i + j \mod n + 1$, $i^{(0)}: J \to I$ by $i^{(0)}(j) = i - j \mod n + 1$. We also define $i^{(0, k)}: J \setminus \{k\} \to I$ by $i^{(0, k)}(j) = j \mod n + 1$ and $i^{(0, k)}: J \setminus \{k\} \to I$ by $i^{(0, k)}(j) = k - j \mod n + 1$.

**Proposition 1.2.1.** For any integers $k, l$ such that $1 \leq k \leq n, l \geq 1$, there exists a unique crystal $B^{k, l}$ of type $A_n^{(1)}$ such that $i^{(0)}(B^{k, l}) = B(l\Lambda_k)$ and $i^{(0)}(B^{k, l}) = B(l\Lambda_k)$ for all $i$, where $k' = n + 1 - k$.

**Theorem 1.2.2.** $B^{k, l}$ is perfect and of level $l$.

Let $B = B(l\Lambda_k)$ \hspace{1em} $(1 \leq k \leq n)$ be the crystal of type $A_n$ as described in [KN]. Set $K = \{1, 2, \ldots, n, n + 1\}$. With each $b \in B$, we associate a table $(m_{j, j'})_{1 \leq j, j' \leq k} = m(b)$ where $m_{j, j'} \in K$, $m_{j, j'} \leq m_{j', j'+1}$ and $m_{j, j'} < m_{j+1, j'}$. Furthermore, we associate another table $(x_{j, i})$ with $m(b)$. Set

$$x_{0, 0} = l, \hspace{1em} x_{0, 1} = x_{0, 2} = \cdots x_{0, n+1} = 0,$$

$$x_{j, i} = \# \{ j' | m_{j, j'} = i \} \hspace{1em} (1 \leq j \leq k, 0 \leq i \leq n + 1),$$

$$y_{j, i} = \sum_{j' \leq j} x_{j, i} \hspace{1em} (0 \leq j \leq k, 0 \leq i \leq n + 1).$$

Then $(x_{j, i}) = x(b) (b \in B)$ satisfies

$$x_{j, i} = 0 \hspace{1em} \text{unless} \hspace{1em} 0 \leq j \leq i \leq n + 1 + j - k,$$

$$y_{j, n+1+j-k} = l \hspace{1em} (0 \leq j \leq k),$$

$$y_{j, i} \geq y_{j+1, i+1} \hspace{1em} (0 \leq j \leq i \leq n + j - k).$$

**Theorem 1.2.3.** An element $b \in B^{k, l}$ is minimal if and only if

$$x_{j, i} = x_{j-1, i-1} \hspace{1em} \text{for} \hspace{1em} 2 \leq j \leq k \hspace{1em} \text{and} \hspace{1em} j + 1 \leq i \leq j + k' - 1.$$

The proofs of Proposition 1.2.1, Theorem 1.2.2, and Theorem 1.2.3 are given in 6.3.

**Remark 1.2.4.** By Proposition 1.2.1, we may take $l(\Lambda_k - \Lambda_0)$ for $B^{k, l}$ as $\lambda_0$ in (1.1.2).

Now we give the description of the bijection $\sigma: (P^+_d)_l \to (P^+_d)_l$ for $A_n^{(1)}$. When $\lambda \in (P^+_d)_l$ can be written $\lambda = \sum_{i=0}^n m_i \Lambda_i$, we shall use the notation $\lambda = (m_0, m_1, \ldots, m_n)$.

**Proposition 1.2.5.** For a perfect crystal $B^{k, l}$ and $\lambda = (m_0, m_1, \ldots, m_n)$ in $(P^+_d)_l$,

$$\sigma: (m_0, m_1, \ldots, m_{k-1}, m_k, \ldots, m_n) \mapsto (m_k, m_{k+1}, \ldots, m_n, m_0, \ldots, m_{k-1}).$$
Proof. Let \( b \) be a minimal element in \( B^{k,l} \). By Theorem 1.2.3, we obtain
\[
\varphi(b) = \sum_{i=1}^{k} (x_{i,i} - x_{i+1,i+1}) \Lambda_i + \sum_{i=k}^{n} x_{i,i} \Lambda_i,
\]
\[
\varepsilon(b) = x_{k,k} \Lambda_0 + \sum_{i=1}^{k} x_{i,i} \Lambda_i + \sum_{i=k+1}^{n} (x_{i-k+1,i+1} - x_{i-k,i}) \Lambda_i.
\]
By the restrictions on \( x_{i,i} \)'s and Theorem 1.2.3, \( x_{1,i+1} = x_{k,k+i} (1 \leq i \leq k' - 1) \) and \( x_{i,i} - x_{i+1,i+1} = x_{i+1,i+k'+1} - x_{i,i+k'} (i \leq i \leq k - 1) \). Hence, we can get the desired result.

1.3. \((C_n^{(1)}, B(l \Lambda_n))(n \geq 2)\). Let \( I = \{0, 1, \ldots, n\} \) be the index set of the simple roots for the quantized universal enveloping algebra of type \( C_n^{(1)} \) and let \( J = \{1, \ldots, n\} \) be that of type \( C_n \). We define \( i, i: J \rightarrow I \) by \( i(j) = j, i(j) = n-j \).

PROPOSITION 1.3.1. For any integer \( l \geq 1 \), there exists a unique crystal \( B^{n,l} \) of type \( C_n^{(1)} \) such that \( i^*(B^{n,l}) = B(l \Lambda_n) \) and \( i^*(B^{n,l}) = B(l \Lambda_n) \).

THEOREM 1.3.2. \( B^{n,l} \) is perfect and of level \( l \).

Let \( B = B(l \Lambda_n) \) be the crystal of type \( C_n \) as described in [KN]. Set \( K = \{1, 2, \ldots, n, n, \ldots, 2, 1\} \). Sometimes it is convenient to identify \( \tilde{i} \) with \( 2n+1-i \). With this identification, the natural order of \( K \) reads \( 1 < 2 \cdots < n < \tilde{n} < \cdots < \tilde{2} < \tilde{1} \). With each \( b \in B \) we associate a table \((m_{jj'}) = m(b)\) where \( m_{jj'} \in K, 1 \leq j \leq n, 1 \leq j' \leq l \). The restriction on \((m_{jj'})\) given in [KN] is translated as follows.

Set
\[
x_{0,0} = l, \quad x_{0,1} = \cdots = x_{0,2n} = 0,
\]
\[
x_{j,k} = \# \{ j' | m_{j,j'} = k \} \quad (1 \leq j \leq n, 0 \leq k \leq 2n),
\]
\[
y_{j,k} = \sum_{j<k',k} x_{j,k'} \quad (0 \leq j \leq n, 0 \leq k \leq 2n).
\]

Then \((x_{j,k}) = x(b), (b \in B)\), satisfies
\[
x_{j,k} = 0 \quad \text{unless } 0 \leq j \leq k \leq j + n \leq 2n,
\]
\[
y_{j,n+j} = l \quad (0 \leq j \leq n),
\]
\[
y_{j*,i+1} - y_{j,i} = 0 \text{ or } 1 \quad (j^* = n + j - i \text{ and } 1 \leq j \leq i \leq n),
\]
\[
y_{j,k} \geq y_{j+1,k+1} \quad (0 \leq j \leq n - 1, 0 \leq k \leq 2n-1).
\]

We also use
\[
l_0 = l, \quad l_j = l - l_{j+n} = y_{j,n} \quad (1 \leq j \leq n),
\]
PERFECT CRYSTALS OF QUANTUM AFFINE LIE ALGEBRAS

\[ z_{j,j^*} = y_{j,i} + y_{j^*,i+1} \quad (0 \leq j \leq j^* \leq n), \]
\[ z_{j,j-1} = l_j + l_{j-1} \quad (1 \leq j \leq n), \]
\[ \omega_{j,i} = z_{j-1,j^*} + z_{j,j^*-1} - z_{j-1,j^*-1} - z_{j,j^*} \quad (1 \leq j \leq i \leq n). \]

Note that \( z_{0,j} = 2l \) and \( z_{j,j} = 2l_j \), \((0 \leq j \leq n)\), and also that \( \omega_{1,i} = z_{1,n-i} - z_{1,n+1-i} \geq 0 \).

**Theorem 1.3.3.** For \( b \in B^{n,l} \) the equality \( \langle c, \varepsilon(b) \rangle = \sum_{i=0}^{n} \varepsilon_i(b) = l \) holds if and only if \( z_{j,j^*} = l_j + l_{j^*} \).

The proofs of Proposition 1.3.1, Theorem 1.3.2, and Theorem 1.3.3 are given in 6.4.

**Remark 1.3.4.** By Proposition 1.3.1, we may take \( l(\Lambda_n - \Lambda_0) \) for \( B^{n,l} \) as \( \lambda_0 \) in (1.1.2).

**Proposition 1.3.5.** For a perfect crystal \( B^{n,l} \) and \( \lambda = (m_0, m_1, \ldots, m_n) \) in \( (P^d_{\lambda}) \),
\[ \sigma: (m_0, m_1, \ldots, m_{n-1}, m_n) \mapsto (m_n, m_{n-1}, \ldots, m_1, m_0). \]

The proof is similar to that of Proposition 1.2.5; so we omit it.

1.4. \((D^{(2)}_{n+1}, B(\Lambda_n)) \) \((n \geq 2)\). Let \( I = \{0, 1, \ldots, n\} \) be the index set of the simple roots for the quantized universal enveloping algebra of type \( D^{(2)}_{n+1} \) and let \( J = \{1, \ldots, n\} \) be that of type \( B_n \). We define \( i: J \to I \) by \( i(j) = j, i(\bar{j}) = n - j \).

**Proposition 1.4.1.** For any integer \( l \geq 1 \), there exists a unique crystal \( B^{n,l} \) of type \( D^{(2)}_{n+1} \) such that \( \iota^*(B^{n,l}) = B(\Lambda_n) \) and \( \iota^*(B^{n,l}) = B(\Lambda_n) \).

**Theorem 1.4.2.** \( B^{n,l} \) is perfect and of level \( l \).

Let \( B = B(\Lambda_n) \) be the crystal of type \( B_n \). The description of this was given in [KN]; however we shall introduce a simpler description of \( B(\Lambda_n) \). Set \( K = \{1, 2, \ldots, n, \bar{n}, \ldots, \bar{2}, \bar{1}\} \). Sometimes it is convenient to identify \( \bar{i} \) with \( 2n + 1 - i \). With this identification, the natural order of \( K \) reads \( 1 < 2 \cdots < n < \bar{n} < \cdots < \bar{2} < \bar{1} \). With each \( b \in B \) we associate a table \( (m_{j,j'}) = m(b) \) where \( m_{j,j'} \in K, 1 \leq j \leq n, 1 \leq j' \leq l \).

The restriction on \( (m_{j,j'}) \) is as follows. Set
\[ x_{0,0} = l, \quad x_{0,1} = \cdots = x_{0,2n} = 0, \]
\[ x_{j,k} = \# \{ j' | m_{j,j'} = k \} \quad (1 \leq j \leq n, k \in K), \]
\[ y_{j,k} = \sum_{j' \leq k' \leq k} x_{j',k'} \quad (0 \leq j \leq n, k \in K). \]
Then \((x_{jk}) = x(b), (b \in B)\), satisfies

\[
x_{j,k} = 0 \quad \text{unless } 0 \leq j \leq k \leq n - j + 1,
\]

\[
y_{j,n-j+1} = l \quad (0 \leq j \leq n),
\]

\[
y_{n+j-i,i+1} - y_{j,i} = 0 \quad (1 \leq j \leq i < n),
\]

\[
y_{j,k} \geq y_{j+1,k+1} \quad (0 \leq j \leq n - 1, 0 \leq k \leq 2n - 1).
\]

Note that the condition \(y_{n+j-i,i+1} - y_{j,i} = 0, (1 \leq j \leq i < n)\), implies that if \(m_{j,i} = k\) (resp. \(\bar{k}\)), then there is no \(j\) such that \(m_{j,i} = \bar{k}\) (resp. \(k\)).

**Theorem 1.4.3.** For \(b \in B^{n,1}\) the equality

\[
\langle c, e(b) \rangle = e_0(b) + 2 \sum_{i=1}^{n-1} e_i(b) + e_n(b) = l
\]

holds if and only if \(x_{j,i} = x_{j+1,i+1}\) for \(1 \leq j < i < n\) and \(x_{j,n} = x_{j+1,n}\) for \(1 \leq j < n\).

The proofs of Proposition 1.4.1, Theorem 1.4.2, and Theorem 1.4.3 are given in 6.5.

**Remark 1.4.4.** By Proposition 1.4.1, we may take \(l(\Lambda_n - \Lambda_0)\) for \(B^{n,1}\) as \(\lambda_0\) in (1.1.2).

**Proposition 1.4.5.** For a perfect crystal \(B^{n,1}\) and \(\lambda = (m_0, m_1, \ldots, m_n)\) in \((P^1)\),

\[
\sigma: (m_0, m_1, \ldots, m_{n-1}, m_n) \mapsto (m_n, m_{n-1}, \ldots, m_1, m_0).
\]

The proof is similar to that of Proposition 1.2.5; so we omit it.

1.5. \((D_n^{(1)}, B(\Lambda_n - \Lambda_1)\) and \(B(\Lambda_n)) (n \geq 4)\). Let \(I = \{0, 1, \ldots, n\}\) be the index set of the simple roots for the quantized universal enveloping algebra of type \(D_n^{(1)}\) and let \(J = \{1, 2, \ldots, n\}\) be that of type \(D_n\). We define \(i, i: J \to I\) by \(i(j) = j, i(j) = n - j\).

**Proposition 1.5.1.** For any integer \(l \geq 1\), there exists a unique crystal \(B^{n,1}\) (resp. \(\overline{B}^{n,1}\)) of type \(D_n^{(1)}\) such that

(i) If \(n\) is even, then \(i^*(\overline{B}^{n,1}) = B(\Lambda_n)\) (resp. \(i^*(\overline{B}^{n,1}) = B(\Lambda_{n-1})\)) and \(i^*(B^{n,1}) = B(\Lambda_n)\) (resp. \(i^*(B^{n,1}) = B(\Lambda_{n-1})\));

(ii) If \(n\) is odd, then \(i^*(\overline{B}^{n,1}) = B(\Lambda_n)\) (resp. \(i^*(\overline{B}^{n,1}) = B(\Lambda_{n-1})\)) and \(i^*(B^{n,1}) = B(\Lambda_n)\) (resp. \(i^*(B^{n,1}) = B(\Lambda_{n-1})\)).

**Theorem 1.5.2.** \(B^{n,1}\) (resp. \(\overline{B}^{n,1}\)) is perfect and of level \(l\).

Let \(B = B(\Lambda_n)\) and \(B' = B(\Lambda_{n-1})\) be the crystals of type \(D_n\). The description of these was given in [KN]; however similarly to the preceding case, we shall introduce simpler descriptions. Set \(K = \{1, 2, \ldots, n, \bar{n}, \ldots, \bar{2}, \bar{1}\}\). We give the order on \(K\) as
follows;

\[ 1 < 2 < \cdots < n - 1 < \frac{n}{n} < n - 1 < \cdots < 2 < 1. \]

Note that there is no order between \( n \) and \( \bar{n} \). With each \( b \in B \) (resp. \( B' \)), we associate a table \((m_{j,j'}) = m(b)\) where \( m_{j,j'} \in K \) for \( 1 \leq j \leq n \) and \( 1 \leq j' \leq l \). The restriction on \((m_{j,j'})\) is as follows. Set

\[
x_{0,0} = l, \quad x_{0,1} = \cdots = x_{0,\bar{1}} = 0,
\]

\[
x_{j,k} = \# \{ j' | m_{j,j'} = k \} \quad (1 \leq j \leq n, \ k \in K),
\]

\[
y_{j,k} = \sum_{j',k' \leq k} x_{j',k'} \quad (0 \leq j \leq n, \ k \in K).
\]

Then \((x_{jk}) = x(b), (b \in B \text{ (resp. } B'))\), satisfies

1. \( x_{j,n} = 0 \) if \( n - j \) is odd (resp. even);
2. \( x_{j,n} = 0 \) if \( n - j \) is even (resp. odd);
3. \( x_{j,k} = 0 \) unless \( 0 \leq j \leq k \leq n - j + 1 \);
4. \( y_{j,n-j+1} = 1 \) (\( 0 \leq j \leq n \));
5. \( y_{n+j-i, \bar{n}+\bar{i}} = x_{j,i} \) (\( 1 \leq j \leq i < n - 1 \));
6. \( y_{j,n} = y_{j-1,n-1} \) if \( n - j \) is even (resp. odd);
7. \( y_{j,n} = y_{j-1,n-1} \) if \( n - j \) is odd (resp. even);
8. \( y_{j,k} \geq y_{j,k'} \) (\( 0 \leq j \leq n - 1, \ k \leq k' \)).

Note that conditions (1) and (2) imply that \( n \) and \( \bar{n} \) cannot appear simultaneously in one row and conditions (5), (6), and (7) imply that \( k \) and \( \bar{k} \) cannot appear simultaneously in one column.

**Theorem 1.5.3.** For \( b \in B^{n,l} \) the equality

\[
\langle c, e(b) \rangle = e_0(b) + e_1(b) + 2 \sum_{k=2}^{n-2} e_k(b) + e_{n-1}(b) + e_n(b) = l
\]

holds if and only if \( x_{1,i} = x_{2,i+1} = \cdots = x_{n-i,n-1} = x_{n-i+3, \bar{n}-1} \) for \( 2 \leq i < n \).

The proofs of Proposition 1.5.1, Theorem 1.5.2, and Theorem 1.5.3 are given in 6.6.

Remark 1.5.4. By Proposition 1.5.1, Theorem 1.5.2, and Theorem 1.5.3, we may take \( l(\Lambda_n - \Lambda_0) \) (resp. \( l(\Lambda_{n-1} - \Lambda_0) \)) for \( B^{n,l} \) (resp. \( B^{n-1,l} \)) as \( \lambda_0 \) in (1.1.2).

**Proposition 1.5.5.** For a perfect crystal \( B^{n,l} \) and \( \lambda = (m_0, m_1, \ldots, m_n) \) in \( (P^+_e) \),

\[
(1) \text{ if } n \text{ is even,}
\]

\[
\sigma: (m_0, m_1, m_2, \ldots, m_{n-2}, m_{n-1}, m_n) \rightarrow (m_{n-1}, m_n, m_{n-2}, \ldots, m_2, m_0, m_1);
\]
(2) if \( n \) is odd,
\[
\sigma: (m_0, m_1, m_2, \ldots, m_{n-2}, m_{n-1}, m_n) \mapsto (m_n, m_{n-1}, m_{n-2}, \ldots, m_2, m_0, m_1).
\]

The proof is similar to that of Proposition 1.2.5; so we omit it.

1.6. \((A^{(2)}_{2n-1}, B(l\Lambda_1) (n \geq 3))\). Let \( I = \{0, 1, \ldots, n\} \) be the index set of the simple roots for the quantized universal enveloping algebra of type \( U_q(A^{(2)}_{2n-1}) \) and let \( J = \{1, \ldots, n\} \) be that of type \( U_q(C_n) \). We define the maps \( i_0, i_1: J \to I \) by \( i_0(j) = j \) for all \( j \in J \) and \( i_1(1) = 0, i_1(j) = j \) for \( j \neq 1 \).

Let \( B(l\Lambda_1) \) be the crystal for \( U_q(C_n) \) with highest weight \( l\Lambda_1 \). Set \( K = \{1, \ldots, n, \bar{n}, \ldots, \bar{1}\} \) and consider the ordering on \( K \) given by
\[
1 < 2 < \cdots < n < \bar{n} < \cdots < \bar{2} < \bar{1}.
\]
Then the elements of \( B(l\Lambda_1) \) are labeled by \( b = (b_k)^l_{k=1} \), where \( b_k \in K, b_k \leq b_{k+1} \) for all \( k \). Let \( x_i(b) = \# \{ k | b_k = i \} \), \( \bar{x}_i(b) = \# \{ k | \bar{b}_k = i \} \) for \( i = 1, \ldots, n \). It is clear that
\[
\sum x_i(b) + \sum \bar{x}_i(b) = l.
\]

**Proposition 1.6.1.** For any integer \( l \geq 1 \), there exists a unique crystal \( B^{1,l} \) for \( U_q(A^{(2)}_{2n-1}) \) such that \( i_0^l(B^{1,l}) \cong B(l\Lambda_1) \) and \( i_1^l(B^{1,l}) \cong B(l\Lambda_1) \) as crystals for \( U_q(C_n) \).

**Theorem 1.6.2.** The crystal \( B^{1,l} \) is perfect and of level \( l \).

**Theorem 1.6.3.** For \( b \in B^{1,l} \), the equality
\[
\langle c, e(b) \rangle = e_0(b) + e_1(b) + 2 \sum_{i=2}^n e_i(b) = l
\]
holds if and only if \( x_i(b) = \bar{x}_i(b) \) for \( i = 2, \ldots, n \).

The proofs of Proposition 1.6.1, Theorem 1.6.2, and Theorem 1.6.3 are given in 6.7.

**Remark 1.6.4.** By Proposition 1.6.1, we may take \( l(\Lambda_1 - \Lambda_0) \) for \( B^{1,l} \) as \( \lambda_0 \) in (1.1.2).

**Proposition 1.6.5.** For a perfect crystal \( B^{1,l} \) and \( \lambda = (m_0, m_1, \ldots, m_n) \) in \((P^+_{cl})_l\),
\[
\sigma: (m_0, m_1, m_2, \ldots, m_{n-1}, m_n) \mapsto (m_1, m_0, m_2, \ldots, m_{n-1}, m_n).
\]

The proof is easily obtained by (6.7.1), (6.7.3), and Theorem 1.6.3.

1.7. \((B^{(1)}_n, B(l\Lambda_1) (n \geq 3))\). Let \( I = \{0, 1, \ldots, n\} \) be the index set of the simple roots for the quantized universal enveloping algebra of type \( U_q(B^{(1)}_n) \) and let \( J = \{1, \ldots, n\} \) be that of type \( U_q(B_n) \). We define the maps \( i_0, i_1: J \to I \) by \( i_0(j) = j \) for all \( j \in J \) and \( i_1(1) = 0, i_1(j) = j \) for \( j \neq 1 \).
Let $B(l\Lambda_1)$ be the crystal for $U_q(B_n)$ with highest weight $l\Lambda_1$. Set $K = \{1, \ldots, n, 0, \bar{n}, \ldots, \bar{1}\}$ and consider the ordering on $K$ given by

$$1 < 2 < \cdots < n < 0 < \bar{n} < \cdots < \bar{2} < \bar{1}.$$  

Then the elements of $B(l\Lambda_1)$ are labeled by $b = (b_k)_{k=0}^n$, where $b_k \in K$, $b_k \leq b_{k+1}$ for all $k$. Let $x_i(b) = \# \{ k | b_k = i \}$, $\bar{x}_i(b) = \# \{ k | b_k = \bar{i} \}$ for $k = 1, \ldots, n$, and set $x_0(b) = \# \{ k | b_k = 0 \}$. Note that $x_0(b) = 0$ or $1$ by [ KN]. It is clear that $x_0(b) + \sum x_i(b) + \sum \bar{x}_i(b) = l$.

**Proposition 1.7.1.** For any integer $l \geq 1$, there exists a unique crystal $B^{1,l}$ for $U_q(B_n^{(1)})$ such that $i_0^*(B^{1,l}) \cong B(l\Lambda_1)$ and $i_1^*(B^{1,l}) \cong B(l\Lambda_1)$ as crystals for $U_q(B_n)$.

**Theorem 1.7.2.** The crystal $B^{1,l}$ is perfect and of level $l$.

**Theorem 1.7.3.** For $b \in B^{1,l}$, the equality

$$\langle c, e(b) \rangle = e_0(b) + e_1(b) + 2 \sum_{i=2}^{n-1} e_i(b) + e_n(b) = l$$

holds if and only if

$$x_i(b) = \bar{x}_i(b) (i = 1, \ldots, n) \text{ and } x_0(b) = \begin{cases} 0 & \text{if } l \text{ is even}, \\ 1 & \text{if } l \text{ is odd}. \end{cases}$$

The proofs of Proposition 1.7.1, Theorem 1.7.2, and Theorem 1.7.3 are given in 6.8.

**Remark 1.7.4.** By Proposition 1.7.1, we may take $l(\Lambda_1 - \Lambda_0)$ for $B^{1,l}$ as $\lambda_0$ in (1.1.2).

**Proposition 1.7.5.** For a perfect crystal $B^{n,l}$ and $\lambda = (m_0, m_1, \ldots, m_n)$ in $(P^+_c)_l$, $\sigma: (m_0, m_1, m_2, \ldots, m_{n-1}, m_n) \mapsto (m_1, m_0, m_2, \ldots, m_{n-1}, m_n)$.

The proof is easily obtained by (6.8.1), (6.8.3), and Theorem 1.7.3.

1.8. $(D_n^{(1)}, B(l\Lambda_1) (n \geq 4))$. Let $I = \{0, 1, \ldots, n\}$ be the index set of the simple roots for the quantized universal enveloping algebra of type $U_q(D_n)$ and let $J = \{1, \ldots, n\}$ be that of type $U_q(D_n)$. We define the maps $i_0, i_1: J \to I$ by $i_0(j) = j$ for all $j \in J$ and $i_1(1) = 0$, $i_1(j) = j$ for $j \neq 1$.

Let $B(l\Lambda_1)$ be the crystal for $U_q(D_n)$ with highest weight $l\Lambda_1$. Set $K = \{1, \ldots, n, \bar{n}, \ldots, \bar{1}\}$ and consider the ordering on $K$ given by

$$1 < 2 < \cdots < n, \bar{n} < \cdots < \bar{2} < \bar{1}.$$  

Then the elements of $B(l\Lambda_1)$ are labeled by $b = (b_k)_{k=1}^n$, where $b_k \in K$, $b_k \leq b_{k+1}$ for
all $k$. Let $x_i(b) = \# \{ k \mid b_k = i \}$, $\bar{x}_i(b) = \# \{ k \mid b_k = \bar{i} \}$ for $k = 1, \ldots, n$. Note that we have either $x_n(b) = 0$ or $\bar{x}_n(b) = 0$. It is clear that $\sum x_i(b) + \sum \bar{x}_i(b) = l$.

**Proposition 1.8.1.** For any integer $l \geq 1$, there exists a unique crystal $B^{1,l}$ for $U_q(D_n^{(1)})$ such that $t_0^*(B^{1,l}) \cong B(l\Lambda_1)$ and $t_0^*(B^{1,l}) \cong B(l\Lambda_1)$ as crystals for $U_q(D_n)$.

**Theorem 1.8.2.** The crystal $B^{1,l}$ is perfect and of level $l$.

**Theorem 1.8.3.** For $b \in B^{1,l}$, the equality

$$\langle c, e(b) \rangle = e_0(b) + e_1(b) + 2 \sum_{i=2}^{n-2} e_i(b) + e_{n-1}(b) + e_n(b) = l$$

holds if and only if $x_i(b) = \bar{x}_i(b)$ for $i = 2, \ldots, n - 1$.

The proofs of Proposition 1.8.1, Theorem 1.8.2, and Theorem 1.8.3 are given in 6.9.

**Remark 1.8.4.** By Proposition 1.8.1, we may take $l(\Lambda_1 - \Lambda_0)$ for $B^{1,l}$ as $\lambda_0$ in (1.1.2).

**Proposition 1.8.5.** For a perfect crystal $B^{n,l}$ and $\lambda = (m_0, m_1, \ldots, m_n)$ in $(P^+_{cl})_l$,

$$\sigma: (m_0, m_1, m_2, \ldots, m_{n-2}, m_{n-1}, m_n) \mapsto (m_1, m_0, m_2, \ldots, m_{n-2}, m_n, m_{n-1})$$

The proof is easily obtained by (6.9.1), (6.9.3), and Theorem 1.8.3.

1.9. $(D_n^{(2)}, B(0) \oplus B(\Lambda_1) \oplus \cdots \oplus B(l\Lambda_1) \ (n \geq 2))$. Let $I = \{ 0, 1, \ldots, n \}$ be the index set of the simple roots for the quantized universal enveloping algebra of type $U_q(D_n^{(2)})$ and let $J = \{ 1, \ldots, n \}$ be that of type $U_q(B_n)$. We define the maps $t_0, t_\sigma: J \rightarrow I$ by $t_0(j) = j$ and $t_\sigma(j) = n - j$ for $j \in J$.

Let $B = B(0) \oplus B(\Lambda_1) \oplus \cdots \oplus B(l\Lambda_1)$ be the direct sum of crystals with highest weight for $U_q(B_n)$. Set $K = \{ 1, \ldots, n, 0, \bar{n}, \ldots, \bar{1} \}$ and consider the ordering on $K$ given by

$$1 < 2 < \cdots < n < 0 < \bar{n} < \cdots < \bar{2} < \bar{1}.$$ 

Then the elements of $B$ are labeled by $b = (b_k)_{k=1}^l$, where $b_k \in K$, $b_k = b_{k+1}$ for all $k$, and $0 \leq j \leq l$. Here we write $b = \phi$ when $j = 0$. Let $x_0(b) = \# \{ k \mid b_k = 0 \}$, $x_i(b) = \# \{ k \mid b_k = i \}$, $\bar{x}_i(b) = \# \{ k \mid b_k = \bar{i} \}$, for $i = 1, \ldots, n$, and let $s(b) = \sum x_i(b) + \sum \bar{x}_i(b)$. Note that $x_0(b) = 0$ or $1$ by [KN], and for $b = (b_k)_{k=1}^l$, $s(b) = j$.

**Proposition 1.9.1.** For any integer $l \geq 1$, there exists a unique crystal $B^{1,l}$ for $U_q(D_n^{(2)})$ such that $t_0^*(B^{1,l}) \cong B(0) \oplus B(\Lambda_1) \oplus \cdots \oplus B(l\Lambda_1)$.
and

\[ t_0^* (B^{1,l}) \cong B(0) \oplus B(\Lambda_1) \oplus \cdots \oplus B(l \Lambda_1) \]

as crystals for \( U_q(B_n) \).

**Theorem 1.9.2.** The crystal \( B^{1,l} \) is perfect and of level \( l \).

**Theorem 1.9.3.** For \( b \in B^{1,l} \), the equality

\[ \langle c, e(b) \rangle = e_0(b) + 2 \sum_{i=1}^{n-1} e_i(b) + e_n(b) = l \]

holds if and only if

\[ t_0^*(b) \in B(l \Lambda_1), \quad x_i(b) = x_i(b)(i = 1, \ldots, n) \text{ and } x_0(b) = \begin{cases} 0 & \text{if } l \text{ is even}, \\ 1 & \text{if } l \text{ is odd}. \end{cases} \]

The proofs of Proposition 1.9.1, Theorem 1.9.2, and Theorem 1.9.3 are given in 6.10.

**Remark 1.9.4.** By Proposition 1.9.1, we may take \( l(\Lambda_1 - \Lambda_0) \) for \( B^{1,l} \) as \( \lambda_0 \) in (1.1.2).

**Proposition 1.9.5.** For a perfect crystal \( B^{1,l} \) and \( \lambda = (m_0, m_1, \ldots, m_n) \) in \( (P_\alpha^+) \),

\[ \sigma: (m_0, m_1, \ldots, m_{n-1}, m_n) \mapsto (m_0, m_1, \ldots, m_{n-1}, m_n). \]

The proof is easily obtained by (6.10.5), (6.10.6), (6.10.13), and Theorem 1.9.3.

1.10. (\( A_{2n}^{(2)} \), \( B(0) \oplus B(\Lambda_1) \oplus \cdots \oplus B(l \Lambda_1) \) \( n \geq 2 \)). Let \( I = \{0, 1, \ldots, n\} \) be the index set of the simple roots for the quantized universal enveloping algebra of type \( U_q(A_{2n}^{(2)}) \). Let \( J_0 = \{1, \ldots, n\} \) be that of type \( U_q(C_n) \) and let \( J_m = \{1, \ldots, n\} \) be that of type \( U_q(B_n) \). We define the maps \( t_0: J_0 \rightarrow I \) by \( t_0(j) = j \) for \( j \in J_0 \) and \( t_n: J_n \rightarrow I \) by \( t_n(j) = n - j \) for \( j \in J_n \).

Let \( \tilde{B} = B(0) \oplus B(\Lambda_1) \oplus \cdots \oplus B(l \Lambda_1) \) be the direct sum of crystals with highest weight for \( U_q(C_n) \). Set \( K = \{1, \ldots, n, \bar{n}, \ldots, \bar{1}\} \) and consider the ordering on \( K \) given by

\[ 1 < 2 < \cdots < n < \bar{n} < \cdots < \bar{2} < \bar{1}. \]

Then the elements of \( \tilde{B} \) are labeled by \( b = (b_k)_{k=1}^\infty \), where \( b_k \in K, b_k \leq b_{k+1} \) for all \( k \), and \( 0 \leq j \leq l \). Here we write \( b = \phi \) when \( j = 0 \). Let \( x_i(b) = \# \{ k | b_k = i \} \), \( \bar{x}_i(b) = \# \{ k | b_k = \bar{i} \} \) for \( i = 1, \ldots, n \), and let \( s(b) = \sum x_i(b) + \sum \bar{x}_i(b) \).

**Proposition 1.10.1.** For any integer \( l \geq 1 \), there exists a unique crystal \( B^{1,l} \) for \( U_q(A_{2n}^{(2)}) \) such that

\[ t_0^*(B^{1,l}) \cong B(0) \oplus B(\Lambda_1) \oplus \cdots \oplus B(l \Lambda_1) \]
as crystals for $U_q(C_n)$ and

$$\iota_q^*(B^{1,1}) \cong B\left(\left(l - 2\left[\frac{l}{2}\right]\Lambda_1\right) \oplus \cdots \oplus B((l - 2)\Lambda_1) \oplus B(l\Lambda_1)\right)$$

as crystals for $U_q(B_n)$.

**Theorem 1.10.2.** The crystal $B^{1,1}$ is perfect and of level $l$.

**Theorem 1.10.3.** For $b \in B^{1,1}$, the equality $\langle c, \varepsilon(b) \rangle = \varepsilon_0(b) + 2\sum_{i=1}^n \varepsilon_i(b) = l$ holds if and only if $x_i(b) = \bar{x}_i(b)$ for $i = 1, \ldots, n$.

The proofs of Proposition 1.10.1, Theorem 1.10.2, and Theorem 1.10.3 are given in 6.11.

**Remark 1.10.4.** By Proposition 1.10.1, we may take $l(\Lambda_1 - \Lambda_0)$ for $B^{1,1}$ as $\lambda_0$ in (1.1.2).

**Proposition 1.10.5.** For a perfect crystal $B^{1,1}$ and $\lambda = (m_0, m_1, \ldots, m_n)$ in $(P_\lambda^+)_{l_0}$,

$$\sigma: (m_0, m_1, \ldots, m_{n-1}, m_n) \mapsto (m_0, m_1, \ldots, m_{n-1}, m_n).$$

The proof is easily obtained by (6.11.1), (6.11.2), (6.11.9), and Theorem 1.10.3.

2. **Polarization.**

2.1. **Order on $\mathbb{Q}(q)$.** We shall give a total order on $\mathbb{Q}(q)$ as follows.

Set $\mathbb{Q}(q)_+ = \bigcap_{n \in \mathbb{Z}} \{q^n(c + qA)|c > 0\}$ and $f \succeq g$ if and only if $f - g \in \mathbb{Q}(q)_+$. Hence $f \succeq g$ if and only if there exists $\varepsilon > 0$ such that $f(q) \geq g(q)$ for $0 < q < \varepsilon$.

2.2. **Positive definite form on $V$.** Let $V$ be a $\mathbb{Q}(q)$ vector space and $(\ , \ )$ a $\mathbb{Q}(q)$-valued symmetric bilinear form on $V$. We say that $(\ , \ )$ is *positive semidefinite* if

$$\begin{align*}
(v, v) &\geq 0 \quad \text{for any } v \in V. \\
(v, v) &> 0 \quad \text{for any nonzero } v \in V.
\end{align*}$$

We say that $(\ , \ )$ is *positive definite* if and only if

$$\begin{align*}
(v, v) &> 0 \quad \text{for any nonzero } v \in V.
\end{align*}$$

Note that $(\ , \ )$ is positive definite (resp. semidefinite) if and only if, for any finite-dimensional $\mathbb{Q}$-subspace $W$ of $V$, $(\ , \ )|_W$ is positive definite (resp. semidefinite) for $0 < q < 1$.

If $(\ , \ )$ is positive semidefinite, we have

$$\begin{align*}
(u + v, u + v) &\leq 2(u, u) + 2(v, v), \\
(u, v)^2 &\leq (u, u)(v, v).
\end{align*}$$
LEMMA 2.2.1. Let $(\ , \ )$ be a positive definite symmetric bilinear form on $V$ and $L = \{u \in V | (u, u) \in A\}$. Then we have

(i) $L$ is an $A$-module;

(ii) $(L, L) \subset A$;

(iii) If $\dim V < \infty$, then $L$ is a free $A$-module of finite rank.

Proof. It is obvious that $L$ is stable by the multiplication of elements of $A$. Hence the first assertion follows from the fact that $L$ is stable by summation, which is an easy consequence of (2.2.3). The assertion (ii) follows from (2.2.4). In order to prove (iii), let us take a free $A$-module $L_0$ of finite rank such that $Q(q) \otimes_A L_0 = V$ and $L_0 \subset L$. Then $L_0 \subset L_0^0 = \{u \in V | (u, L_0) \subset A\}$ from (ii). Since $L_0^0$ is a finitely generated $A$-module, $L$ is also finitely generated over $A$.

Remark. Under the assumption of Lemma 2.2.1, the $Q$-valued symmetric bilinear form on $L/qL$ induced by $(\ , \ )$ is positive semidefinite but not positive definite in general, as seen by the example $V = Q(q)u, (u, u) = q$ and $L = Au$.

The following lemma gives a sufficient condition for a given $L$ to be equal to $\{u \in V | (u, u) \in A\}$.

LEMMA 2.2.2. Let $(\ , \ )$ be a bilinear symmetric form on a $Q(q)$ vector space $V$ and $L$ a free $A$-submodule of $V$ such that $V \cong Q(q) \otimes_A L$. Assume that

$$ (L, L) \subset A, $$

$$ (\ , \ )_0 \text{ is positive definite}, $$

where $(\ , \ )_0$ is the $Q$-valued symmetric form on $L/qL$ induced by $(\ , \ )$. Then $(\ , \ )$ is positive definite and

$$ L = \{v \in V | (v, v) \in A\}, $$

$$ L = \{v \in V | (v, L) \subset A\}. $$

Proof. For a nonzero $v \in V$, let us take $n$ such that $v \in q^n L$ and $v \notin q^{n+1} L$. Then $(v, v) \in q^{2n}((q^{-n}v, q^{-n}v)_0 + qA)$ and $(q^{-n}v, q^{-n}v)_0 > 0$ by (2.2.6). Hence $(v, v) > 0$. Therefore $(\ , \ )$ is positive definite. Now we shall show (2.2.7). Assume that $v \in V$ satisfies $(v, v) \in A$. Let us take the smallest $n \geq 0$ such that $v \in q^n L$. If $n > 0$, then $q^n v \notin q L$ and hence by (2.2.6) $(q^n v, q^n v) \notin qA$, which is a contradiction. Hence $n = 0$ and $v \in L$. This proves (2.2.7). Finally we shall show (2.2.8). For $v \in V$ such that $(v, L) \subset A$, we take the smallest $n \geq 0$ such that $q^n v \in L$. If $n > 0$, then $(q^n v, L/qL)_0 = 0$ and hence by (2.2.6) $q^n v \equiv 0$ mod $q L$. This is a contradiction. □

2.3. Z-form. Let us introduce the subalgebras $A_Z$ and $K_Z$ of $Q(q)$ as follows:

$$ A_Z = \{f(q)/g(q) | f(q), g(q) \in Z[q], g(0) = 1\}, $$

$$ K_Z = A_Z[q^{-1}]. $$
Then we have

\[(2.3.2) \quad K_Z \cap A = A_Z.\]

The following lemma is immediate.

**Lemma 2.3.1.** (i) $qA_Z$ is the Jacobson radical of $A_Z$ (i.e., any element of $1 + qA_Z$ is invertible).

(ii) $A_Z/qA_Z \cong \mathbb{Z}$.

Let $V$ be a $\mathbb{Q}(q)$-vector space and $(\ , \ )$ a positive definite symmetric bilinear form on $V$. Let $L$ be a free $A$-submodule of $V$ such that $V = \mathbb{Q}(q) \otimes_A L$ and $V_{K_Z}$ a $K_Z$-submodule of $V$ such that $V = \mathbb{Q}(q) \otimes_{K_Z} V_{K_Z}$. Assume

\[(2.3.3) \quad (V_{K_Z}, V_{K_Z}) \subseteq K_Z,
\]

\[(2.3.4) \quad (L, L) \subseteq A.
\]

Let $(\ , \ )_0$ be the induced $\mathbb{Q}$-valued symmetric form on $L/qL$. By (2.3.3) and (2.3.4), $(\ , \ )_0$ is $\mathbb{Z}$-valued on $V_{K_Z} \cap L/V_{K_Z} \cap qL$. Assume further that

\[(2.3.5) \quad (\ , \ )_0 \text{ is positive definite},
\]

\[(2.3.6) \quad B = \{b \in V_{K_Z} \cap L/V_{K_Z} \cap qL | (b, b)_0 = 1\} \text{ generates } L/qL \text{ over } \mathbb{Q}.
\]

**Lemma 2.3.2.** Assume (2.3.3–2.3.6). Then we have

(i) $B$ is pseudobase of $L/qL$;

(ii) $V_{K_Z} \cap L/V_{K_Z} \cap qL = \sum_{b \in B} Zb$.

**Proof.** We shall take $B' \subseteq B$ such that $B = B' \cup (-B')$ and $B' \cap (-B') = \phi$. Then $B'$ also generates $L/qL$. For $b_1, b_2 \in B$, we have $(b_1, b_2)_0^2 \leq (b_1, b_1)_0(b_2, b_2)_0 = 1$. If $(b_1, b_2)_0^2 = 1$, then $(b_1, b_2)_0 = \pm 1$ and hence $(b_1 \mp b_2, b_1 \mp b_2)_0 = 0$, which implies $b_1 = \pm b_2$. Thus $B'$ is an orthonormal base of $L/qL$, which proves (i). For $u \in V_{K_Z} \cap L/V_{K_Z} \cap qL$, let us write $u = \sum_{b \in B} a_b b$. Then $a_b = (u, b)_0$ is an integer. Thus we obtain (ii). 

2.4. **Polarization.** Let $M$ and $N$ be a $U_q(g)$-module. A bilinear form $(\ , \ ) : M \otimes_{\mathbb{Q}(q)} N \to \mathbb{Q}(q)$ is called an admissible pairing if it satisfies

\[(q^h u, v) = (u, q^h v),
\]

\[(2.4.1) \quad (e_i u, v) = (u, q_i^{-1} t_i^{-1} f_i v),
\]

\[(f_i u, v) = (u, q_i^{-1} t_i e_i v),
\]

for all $u \in M$ and $v \in N$. 

Let $M$ be a $U_q(\mathfrak{g})$-module. A symmetric bilinear form $(\ ,\ )$ on $M$ is called a prepolarization of $M$ if it satisfies (2.4.1) for $u, v \in M$.

Let $\psi$ be the anti-automorphism of $U_q(\mathfrak{g})$ given by

\begin{equation}
\psi(q^h) = q^h, \quad \psi(e_i) = q_i^{-1}t_i^{-1}f_i, \quad \psi(f_i) = q_i^{-1}t_ie_i.
\end{equation}

Then we have

\begin{equation}
(Pu, v) = (u, \psi(P)v) \quad \text{for any } P \in U_q(\mathfrak{g}).
\end{equation}

In particular, we have

\begin{align*}
(e_i^{(n)}u, v) &= (u, q_i^{-n}t_i^{-n}f_i^{(n)}v), \\
(f_i^{(n)}u, v) &= (u, q_i^{-n}t_i^{n}e_i^{(n)}v).
\end{align*}

A prepolarization is called a polarization if it is positive definite. The following proposition is proved in [K4].

**Proposition 2.4.1.** For any $\lambda \in P_+$, $V(\lambda)$ has a polarization $(\ ,\ )$ such that the crystal lattice $L(\lambda)$ is characterized by $L(\lambda) = \{u \in V(\lambda)| (u, u) \in A\}$. Moreover, $B(\lambda)$ is an orthonormal base of $L(\lambda)/qL(\lambda)$ with respect to the induced symmetric bilinear form on it.

**Corollary 2.4.2.** Let $M$ be an integrable $U_q(\mathfrak{g})$-module in $O_{\text{int}}(\mathfrak{g})$ and $(\ ,\ )$ a prepolarization on $M$. If $(\ ,\ )$ is positive definite on $H = \{u \in M| e_iu = 0 \text{ for all } i\}$, then $(\ ,\ )$ is a polarization. If $(\ ,\ )_0$ is positive definite on $H \cap L/H \cap qL$, then $(\ ,\ )_0$ is positive definite on $L/qL$.

**Proof.** We have the orthogonal decomposition

\[ M = \bigoplus_{\lambda \in P_+} H_\lambda \otimes V(\lambda). \]

If we denote by $(\ ,\ )_\lambda$ the polarization on $V(\lambda)$ such that $(u_\lambda, u_\lambda) = 1$, then for $v \in H_\lambda$ and $u \in V(\lambda)$,

\[(v \otimes u, v \otimes u) = (v, v)(u, u)_\lambda.\]

Then the assertion follows from the fact that the tensor product of positive definite forms is positive definite. The last statement is similarly proved. \qed

**Lemma 2.4.3.** Let $u, u' \in M_\lambda$ and $e_iu = e_iu' = 0$. Then

\[ (f_i^{(k)}u, f_i^{(k)}u') = q_i^{k(\langle h_i, \lambda \rangle - k)} \left[ \frac{\langle h_i, \lambda \rangle}{k} \right]_i (u, u'). \]
Proof. By (2.4.4), we have
\[
(f^{(k)}_i u, f^{(k)}_i u') = (u, q_i^{-k^2} t_i^k e^i f^{(k)}_i u')
\]
\[
= q_i^{k (\langle h_i, \lambda \rangle \cdot k)} (u, e^i f^{(k)}_i u').
\]
On the other hand, \(e^i f^{(k)}_i = \sum f^{(k-I)}_i e^{(k-I)}_i (t_i) \mid i \) implies \(e^i f^{(k)}_i u' = [\langle h_i, \lambda \rangle] u'\). Thus we obtained the desired result. \(\square\)

**Proposition 2.4.4.** Assume that \(M\) is an integrable \(U_q(\mathfrak{g})\)-module and \(\dim M \leq \infty\) for any \(\lambda\). Let \(\langle , \rangle\) be a polarization on \(M\). Then we have
(i) \((\tilde{e}_i u, \tilde{e}_i u) \leq (1 + q)(u, u)\) and \((\tilde{f}_i u, \tilde{f}_i u) \leq (1 + q)(u, u)\) for any \(u\) and \(i\);
(ii) \(L = \{u \in M \mid (u, u) \in \Lambda\}\) is a crystal lattice of \(M\).

Proof. (i) We may assume \(u \in M \lambda\). Set \(u = \sum f^{(k)}_i u_k\) where \(u_k \in M_{\lambda + k\alpha_i} \cap \operatorname{Ker} e_i\). Then \(f^{(k)}_i u = \sum f^{(k+1)}_i u_k\). By Lemma 2.4.3, we have
\[
(u, u) = \sum_k q_i^{k (\langle h_i, \lambda \rangle \cdot k) + 2k} \left[ \frac{n + k}{k} \right] (u_k, u_k)
\]
and
\[
(\tilde{f}_i u, \tilde{f}_i u) = \sum_k q_i^{k (\langle h_i, \lambda \rangle \cdot k) + k - 1} \left[ \frac{n + k}{k + 1} \right] (u_k, u_k).
\]
Hence, \((\tilde{f}_i u, \tilde{f}_i u) \leq (1 + q)(u, u)\) follows from \((u_k, u_k) \geq 0\) and
\[
q_i^{(k+1)(n-1)} \left[ \frac{n + k}{k + 1} \right] \leq (1 + q) q_i^{n^2} \left[ \frac{n + k}{k} \right] \quad \text{for } k, n \geq 0.
\]
The statement on \(\tilde{e}_i\) is similarly proved.
(ii) By Lemma 2.2.1, \(L\) is a free \(\Lambda\)-module and \(L\) is stable by \(\tilde{e}_i\) and \(\tilde{f}_i\) by (i). \(\square\)

**Lemma 2.4.5.** Let \((\ , \ )\) be a polarization on an integrable \(U_q(\mathfrak{g})\)-module \(M\). Then for \(\lambda \in P\) and \(u \in M_\lambda\), we have
\[
(\tilde{f}_i u, \tilde{f}_i u) \leq q_i^{2(\langle h_i, \lambda \rangle + \langle h_i, \lambda \rangle)} (f_i u, f_i u) \quad \text{and} \quad (\tilde{e}_i u, \tilde{e}_i u) \leq q_i^{2(1 + \langle h_i, \lambda \rangle)} (e_i u, e_i u).
\]

Proof. Set \(u = \sum f^{(k)}_i u_k\) where \(u_k \in M_{\lambda + k\alpha_i} \cap \operatorname{Ker} e_i\). We have
\[
(\tilde{f}_i u, \tilde{f}_i u) = \sum (f^{(k+1)}_i u_k, f^{(k+1)}_i u_k)
\]
and
\[
(f_i u, f_i u) = \sum [k + 1]^2 (f^{(k+1)}_i u_k, f^{(k+1)}_i u_k).
\]
If \( k + 1 > \langle h_i, \lambda + kx_i \rangle \) then \( f_i^{k+1}u_k = 0 \). Hence we may assume \( k \geq 1 - \langle h_i, \lambda \rangle \) which implies \( q^{2(1-\langle h_i, \lambda \rangle)}[k + 1]^2 \geq 1 \). This shows the first inequality. The second inequality follows from the involution of \( U_q(\mathfrak{g}) \), \( f_i \mapsto e_i, e_i \mapsto f_i, q^h \mapsto q^{-h} \).

**Lemma 2.4.6.** Let \( L \) be a crystal lattice of an integrable \( U_q(\mathfrak{g}) \)-module \( M \), \( (\ , \ ) \) a pre-polarization on \( M \) such that \( (L, L) \subseteq A \) and \( (\ , \ )_0 \) is the induced symmetric bilinear form on \( L/qL \). Then \( (\tilde{e}_i u, v)_0 = (u, \tilde{f}_i v)_0 \) for any \( u, v \in L/qL \).

**Proof.** We may assume \( u = f_i^{(k)}u' \) and \( v = f_i^{(j)}v' \) where \( u', v' \in L \) and \( e_i u' = e_i v' = 0 \). Then Lemma 2.4.3 implies

\[
(\tilde{e}_i u, v) = (f_i^{(k-1)}u', f_i^{(j)}v') = \delta_{k-1, j} (f_i^{(j)}u', f_i^{(j)}v') \in \delta_{k-1, j} (1 + qA)(u', v').
\]

Similarly, we have \( (u, \tilde{f}_i v) = (f_i^{(k)}u', f_i^{(j+1)}v') \in \delta_{k, j+1} (1 + qA)(u', v') \). \( \square \)

2.5. The complete reducibility of \( U_q(\mathfrak{g})_{KZ} \)-modules. Let us denote by \( U_q(\mathfrak{g})_Z \) the \( Z[q, q^{-1}] \)-subalgebra of \( U_q(\mathfrak{g}) \) generated by \( e_i^{(n)} \), \( f_i^{(n)} \), \( q^h \) and \( \{ n \} \). Let us denote by \( U^+ q(\mathfrak{g})_Z \) (resp. \( U^- q(\mathfrak{g})_Z \)) the \( Z[q, q^{-1}] \)-subalgebra of \( U_q(\mathfrak{g}) \) generated by \( e_i^{(n)} \) (resp. \( f_i^{(n)} \)). We set \( U_q(\mathfrak{g})_{KZ} = K_Z \otimes U_q(\mathfrak{g})_Z, U^q(\mathfrak{g})_{KZ} = K_Z \otimes U^{q_+}(\mathfrak{g})_Z \). Let \( M \) be a \( U_q(\mathfrak{g}) \)-module \( M \) in \( O_{int}(\mathfrak{g}) \). For \( \lambda \in P_+ \) we denote by \( I_\lambda(M) \) the isotypic component of \( M \) of type \( V(\lambda) \). Hence

\[
(2.5.1) \quad M \simeq \bigoplus_{\lambda \in P_+} I_\lambda(M)
\]

and

\[
(2.5.2) \quad I_\lambda(M) \simeq \text{Hom}_{U_q(\mathfrak{g})}(V(\lambda), M) \otimes V(\lambda).
\]

The purpose of this section is to prove the following proposition.

**Proposition 2.5.1.** Let \( M \) be an \( U_q(\mathfrak{g}) \)-module in \( O_{int}(\mathfrak{g}) \) such that \( I_\lambda(M) = 0 \) except for finitely many \( \lambda \in P_+ \). Let \( M_{KZ} \) be a \( U_q(\mathfrak{g})_{KZ} \)-submodule of \( M \). Then \( M_{KZ} \simeq \bigoplus_{\lambda \in P_+} (M_{KZ} \cap I_\lambda(M)) \) and \( M_{KZ} \cap I_\lambda(M) \simeq (I_\lambda(M)_{\lambda} \cap M_{KZ}) \otimes_{K_Z} V(\lambda)_{KZ} \). Here \( V(\lambda)_{KZ} \) is the \( U_q(\mathfrak{g})_{KZ} \)-submodule of \( V(\lambda) \) generated by the highest-weight vector \( u_\lambda \).

In order to prove this, we shall prove the following lemma.

**Lemma 2.5.2.** For \( \lambda \in P_+ \) and \( \mu \in \lambda - Q_+ \), there exist finitely many \( P_k \in (U^+ q(\mathfrak{g})_{KZ})_{\lambda - \mu} \) and \( Q_k \in (U^- q(\mathfrak{g})_{KZ})_{\mu - \lambda} \) such that \( u = \sum_k P_k u \) for any \( u \in V(\lambda)_{\mu} \).

**Proof.** Set \( V(\lambda)_Z = U_q(\mathfrak{g})_Z u_\lambda \). Then \( V(\lambda)_Z = \sum_{b \in B(\lambda)} Z[q, q^{-1}] G_b(\lambda) \) where \( G_b(\lambda) \) is the (lower) global base (see [K4]). Then we have \( (G_b(\lambda), G_b(\lambda')) \in \delta_{bb'} + qA_Z \). Hence, \( \det((G_b(\lambda), G_b(\lambda')))_{b \in B(\lambda)} \) is invertible in \( A_Z \) (see Lemma 2.3.1). Therefore, there exists \( G^{\pm}_b(\lambda) \in K_Z \otimes V(\lambda)_{\mu} \) such that \( (G^{\pm}_b(\lambda), G^{\pm}_b(\lambda')) = \delta_{bb'} \). Let us write \( G^{\pm}_b(\lambda) = Q(b)u_\lambda \) and \( G^{\pm}_b(\lambda) = R(b)u_\lambda \) for \( Q(b), R(b) \in (U^- q(\mathfrak{g})_{KZ})_{\mu - \lambda} \)
Now we shall show

\[(2.5.3) \quad \sum_{b \in B(\lambda)_u} Q(b)\psi(R(b))u = u \quad \text{for any } u \in V(\lambda)_u.\]

For any \(b_0 \in B(\lambda)_u\), we have

\[
(\psi(R(b))G_\lambda(b_0), u_\lambda) = (G_\lambda(b_0), R(b)u_\lambda) = \delta_{bb_0}.
\]

Since \(\psi(R(b))G_\lambda(b_0)\) is a constant multiple of \(u_\lambda\), we obtain

\[
\psi(R(b))G_\lambda(b_0) = \delta_{bb_0}u_\lambda.
\]

Thus we obtain

\[
\sum_b Q(b)\psi(R(b))G_\lambda(b_0) = \sum_b \delta_{bb_0}Q(b)u_\lambda = G_\lambda(b_0).
\]

This shows (2.5.3). Now it is enough to note that there exists \(P(b) \in (U_q^+(g))_{K'_Z}\) such that \(P(b)u = \psi(R(b))u\) for all \(u \in V(\lambda)_u\).

**Corollary 2.5.3.** Let \(\lambda \in P_+\), let \(M\) be a direct sum of copies of \(V(\lambda)\), and let \(M_{K'_Z}\) be a \(U_q(g)_{K'_Z}\)-submodule. Then

\[M_{K'_Z} \simeq (M_\lambda \cap M_{K'_Z}) \otimes V(\lambda)_{K'_Z}.\]

**Proof.** It is obvious that \(M_{K'_Z} \supseteq (M_\lambda \cap M_{K'_Z}) \otimes V(\lambda)_{K'_Z}\). Let us show the other inclusion. For \(\mu \in \lambda - Q_+\) and \(u \in (M_{K'_Z})_u\), we have \(u = \sum Q_k P_k u\) where \(Q_k\) and \(P_k\) are as in Lemma 2.5.2. Then \(P_k u \in M_\lambda \cap M_{K'_Z}\), and hence \(Q_k P_k u \in (M_\lambda \cap M_{K'_Z}) \otimes V(\lambda)_{K'_Z}\).

**Proof of Proposition 2.5.1.** Set \(S = \{\lambda \in P_+ | I_\lambda(M) \neq 0\}\) and \(H = \{u \in M | e_iu = 0\text{ for all } i\}\). By induction, it is enough to show that, for any \(\lambda \in S\) such that \((\lambda + Q_+) \cap S = \{\lambda\}\), \(M_{K'_Z} = (N \cap M_{K'_Z}) \otimes (H_\lambda \cap M_{K'_Z}) \otimes V(\lambda)_{K'_Z}\), where \(N = \bigoplus_{\lambda' \neq \lambda} I_{\lambda'}(M)\).

By the assumption on \(\lambda\), we have \(M_\lambda = I_\lambda(M) = H_\lambda\). Let us consider the exact sequence

\[(2.5.4) \quad 0 \to N \to M \xrightarrow{i} H_\lambda \otimes V(\lambda) \to 0.\]

Then \(\pi(M_{K'_Z}) = (H_\lambda \cap M_{K'_Z}) \otimes V(\lambda)_{K'_Z}\) by Corollary 2.5.3. On the other hand, \(M_{K'_Z} \supseteq (H_\lambda \cap M_{K'_Z}) \otimes V(\lambda)_{K'_Z}\). Thus \(M_{K'_Z} = (N \cap M_{K'_Z}) \oplus \pi(M_{K'_Z})\).

**2.6. Criterion for the existence of crystal pseudobase.**

**Proposition 2.6.1.** Let \(M\) be an integrable \(U_q(g)\)-module such that \(\dim M_\lambda < \infty\) for all \(\lambda \in P\), let \(M_{K'_Z}\) be a \(U_q(g)_{K'_Z}\)-submodule of \(M\), and let \((\ , \ )\) be a polarization on
\[ M \text{ such that } (M_{K_Z}, M_{K_Z}) \subseteq K_Z. \text{ Let } L \text{ be a free } A\text{-submodule of } M \text{ such that } (L, L) \subseteq A \text{ and } Q(q) \otimes_A L = M. \text{ Assume that} \]

\begin{align*}
(2.6.1) & \quad \text{the induced bilinear from } (\ , \ )_0 \text{ on } L/qL \text{ is positive definite,} \\
(2.6.2) & \quad B = \{ b \in M_{K_Z} \cap L/M_{K_Z} \cap qL | (b, b)_0 = 1 \} \text{ generates } L/qL.
\end{align*}

Then \((L, B)\) is a crystal pseudobase.

**Proof.** By Lemma 2.2.2 and Proposition 2.4.4, \(L\) is a crystal lattice of \(M\). Lemma 2.3.2 implies that \(B\) is a pseudobase of \(L/qL\). By Proposition 2.4.4, \((\ , \ )_0\) satisfies

\[(e_i u, e_i u)_0 \leq (u, u)_0 \quad \text{and} \quad (f_i u, f_i u)_0 \leq (u, u)_0 \quad \text{for } u \in L/qL.\]

Hence \(B \cup \{0\}\) is stable by \(\tilde{e}_i\) and \(\tilde{f}_i\). Let us show that, if \(b \in B\) and \(\tilde{e}_i b \in B\), then \(\tilde{f}_i \tilde{e}_i b = b\). Lemma 2.4.6. implies

\[(\tilde{f}_i \tilde{e}_i b, b)_0 = (\tilde{e}_i b, \tilde{e}_i b)_0 = 1. \quad (\tilde{f}_i \tilde{e}_i b, \tilde{f}_i \tilde{e}_i b)_0 = (\tilde{e}_i b, \tilde{e}_i \tilde{f}_i \tilde{e}_i b)_0 = (\tilde{e}_i b, \tilde{e}_i b)_0 = 1. \quad \text{Hence } (\tilde{f}_i \tilde{e}_i b - b, \tilde{f}_i \tilde{e}_i b - b)_0 = 0, \text{ which implies } b = \tilde{f}_i \tilde{e}_i b. \]

Similarly, if \(b \in B\) and \(\tilde{f}_i b \in B\), then \(\tilde{e}_i \tilde{f}_i b = b\). \(\square\)

**PROPOSITION 2.6.2.** Assume that \(q\) is finite-dimensional and let \(M\) be a finite-dimensional integrable \(U_q(g)\)-module. Let \((\ , \ )_0\) be a prepolarization on \(M\), and \(M_{K_Z}\) a \(U_q(g)\)-submodule of \(M\) such that \((M_{K_Z}, M_{K_Z}) \subseteq K_Z\). Let \(\lambda_1, \ldots, \lambda_m \in P_+\), and we assume the following conditions.

\begin{align*}
(2.6.3) & \quad \dim M_{\lambda_k} \leq \sum_{j=1}^m \dim V(\lambda_j)_{\lambda_k} \quad \text{for } k = 1, \ldots, m. \\
(2.6.4) & \quad \text{There exist } u_j \in (M_{K_Z})_{\lambda_j} (j = 1, \ldots, m) \text{ such that } (u_j, u_k) \in \delta_{jk} + qA, \\
& \quad \text{and } (e_i u_j, e_i u_j) \in qA - 2(1 + \langle h_i, \lambda_j \rangle)A \text{ for all } i \in I.
\end{align*}

Set \(L = \{ u \in M | (u, u) \in A \}\) and set \(B = \{ b \in M_{K_Z} \cap L/M_{K_Z} \cap qL | (b, b)_0 = 1 \}\). Then we have the following.

(i) \((\ , \ )_0\) is a polarization on \(M\).

(ii) \(M \simeq \bigoplus V(\lambda)\).

(iii) \((\ , \ )_0\) is positive definite, and \((L, B)\) is a crystal pseudobase of \(M\).

**Proof.** Let \(Q_+ = \sum Z_{\geq 0} a_i\). For \(\lambda \in P_+\) let \(I_\lambda(M)\) be the isotypic component of \(M\) of type \(V(\lambda)\). Then \(M = \bigoplus I_\lambda(M)\) is an orthogonal decomposition with respect to \((\ , \ )_0\). We shall prove the following for each \(\lambda \in P_+\).

\begin{align*}
(2.6.5)_\lambda & \quad (\ , \ )_0|_{I_\lambda(M) \cap L/I_\lambda(M) \cap qL} \text{ is positive definite.} \\
(2.6.6)_\lambda & \quad I_\lambda(M) = V(\lambda)^{\otimes s} \quad \text{where } s = \# \{ j | \lambda_j = \lambda \}. \\
(2.6.7)_\lambda & \quad \text{There exist } v_j \in I_\lambda(M) \cap M_{K_Z} \text{ for } j \text{ such that } \lambda_j = \lambda \text{ satisfying } (v_j, v_j) \in \delta_{jj'} + qA.
\end{align*}
By induction on \( \lambda \), it is enough to show (2.6.5–2.6.7)\(_\lambda \), under the assumptions that (2.6.5–2.6.7)\(_\lambda \) hold for \( \lambda' \in P_+ \cap (\lambda + Q_+) \setminus \{ \lambda \} \). Set \( N = \bigoplus_{\lambda' \in P_+ \cap (\lambda + Q_+) \setminus \{ \lambda \}} I_{\lambda'}(M) \). By Corollary 2.4.2, \( (\ , \ )_N \) is a polarization. Therefore, by Proposition 2.4.4, \( L \cap N \) is a crystal lattice of \( N \). Then by Corollary 2.4.2, \( (\ , \ )_0|_{N \cap L/\langle \lambda \rangle qL} \) is positive definite.

Set \( D = \{ j | \lambda_j = \lambda \} \). For \( j \in D \) we write

\[
u_j = v_j + u'_j \]

with \( v_j \in I_{\lambda}(M) \) and \( u'_j \in N \). Proposition 2.5.1 implies that \( v_j \) and \( u'_j \) belong to \( M_{K_+} \).

Then \( (e_i u_j, e_i u'_j) = (e_i u'_j, e_i u_j) \in q\langle \lambda_i \rangle^{-2(1 + \langle h_i, \lambda \rangle)^2} A \) by (2.6.4). Hence Lemma 2.4.5 implies that \( (\bar{e}_i u'_j, \bar{e}_i u_j) \in qA \), and by (2.6.5) \( \bar{e}_i u'_j \in qL \) for any \( i \). Since \( N \) has no highest-weight vector of weight \( \lambda \), we have \( \{ v \in N_\lambda \cap L/N_\lambda \cap qL \bar{e}_i v = 0 \text{ for all } i \in I \} = 0 \). This implies \( u'_j \in qL \). Thus we obtain \( (u'_j, u'_j) \in qA \). Therefore \( (v_j, v_j) = (u_j, u_j) - (u'_j, u'_j) \in \bar{e}_j qL \). Thus we obtain (2.6.7)s. Moreover, \( M \) contains \( V(\lambda) \) at least \( \# D \)-times.

On the other hand, (2.6.3) implies that \( M \) contains \( V(\lambda) \) at most \( \# D \)-times. Thus we have (2.6.7)s. Finally, (2.6.5)s is a consequence of (2.6.7)s and Corollary 2.4.2.

Thus we obtain (2.6.5–2.6.7)s for any \( \lambda \in P_+ \). Then (i) and (ii) are consequences of (2.6.5)s and (2.6.6)s. By Proposition 2.4.4, \( B \uplus \{ 0 \} \) is invariant by \( \bar{e}_i \) and \( f_i \). By (2.6.7)s we can show that \( B \) generates \( H \cap L/H \cap qL \). Where \( H = \{ u \in M | e_i u = 0 \text{ for all } i \in I \} \). Thus \( B \) generates \( L/qL \). Hence by Proposition 2.6.1 \( (L, B) \) is a crystal pseudobase of \( M \).

\[ \square \]

3. Fusion construction.

3.1. Elementary representations. We follow the notations in Section 2. In this section we construct \( U'_q(\mathfrak{g}) \)-modules with perfect crystal pseudobase. We employ the fusion construction. Namely, we construct first a \( U'_q(\mathfrak{g}) \)-module whose crystal base is perfect and of level 1 and then construct general ones by using its tensor products and \( R \)-matrix.

Let \( V \) be a finite-dimensional integrable \( U'_q(\mathfrak{g}) \)-module. We assume that there is a \( U'_q(\mathfrak{k}_+) \)-submodule \( V_{k_0} \) of \( V \) such that \( V_{k_0} \) is a finitely generated \( k_0 \) module and \( V = Q(\mathfrak{g}) \otimes_{k_0} V_{k_0} \). Let \( (\ , \ ) \) be a polarization of \( V \).

Let \( (L, B) \) be a crystal base of \( V \) satisfying the following property.

\[
B = \text{perfect of level } l = 1.
\]

In particular, \( V \) is an irreducible \( U'_q(\mathfrak{g}) \)-module by (4.6.1) and Lemma 3.4.4 in [KMN]. Let \( \lambda_0 \) be an element of \( P_0 \) as in (4.6.2) in [KMN]. We shall take \( u_0 \in L_{\lambda_0} \) such that \( B_{\lambda_0} = \{ u_0 \mod qL \} \). We may assume, by replacing \( V_{k_0} \),

\[
V_{k_0} = U'_q(\mathfrak{g})_{k_0} u_0.
\]

In particular, we have

\[
V_{k_0} \cap Q(\mathfrak{g}) u_0 = K_{k_0} u_0.
\]
In fact, if $V_{k_2} \cap \mathcal{Q}(q)u_0 \ni \varphi u_0$ for $\varphi \in \mathcal{Q}(q)$, then $V_{k_2} \ni U_q'(g)_{k_2} \varphi u_0 = \varphi V_{k_2}$. Hence $\varphi \in K_{k_2}$.

By (4.6.2) in [KMN$^2$], we have $\#(B \otimes B)_{21} = 1$. Hence using (4.6.1) and Lemma 3.4.4 in [KMN$^2$], $V \otimes V$ is an irreducible $U_q'(g)$-module. Then we can apply Theorem 3.4.1 in [KMN$^2$]. Hence there exists a $U_q'(g)$-linear endomorphism $R$ of $\text{Aff}(V) \otimes \text{Aff}(V)$ satisfying

(3.1.4) \[(1 \otimes T) \circ R = R \circ (T \otimes 1) \quad \text{and} \quad (T \otimes 1) \circ R = R \circ (1 \otimes T),\]

(3.1.5) \[(R \otimes 1) \circ (1 \otimes R) \circ (R \otimes 1) = (1 \otimes R) \circ (R \otimes 1) \circ (1 \otimes R),\]

(3.1.6) \[R(af(u_0) \otimes af(u_0)) = \varphi(T^{-1} \otimes T)(af(u_0) \otimes af(u_0)),\]

for a nonzero $\varphi(T^{-1} \otimes T) \in \mathbb{Z}[q, q^{-1}, T^{-1} \otimes T, T \otimes T^{-1}]$. Since $R^2$ is in $\mathcal{Q}(q)(T \otimes T^{-1})$, we obtain

(3.1.7) \[R^2 = \varphi(T \otimes T^{-1}) \varphi(T^{-1} \otimes T).\]

By normalizing the bilinear form $(\ , \ )$ we may assume that

(3.1.8) \[(u_0, u_0) = 1.\]

This implies that

(3.1.9) \[(V_{k_2}, V_{k_2}) \subset K_{k_2}.\]

In fact, $(V_{k_2}, V_{k_2}) = (V_{k_2}, u_0) \subset ((V_{k_2})_{i_0}, u_0) \subset (K_{k_2}u_0, u_0) \subset K_{k_2}$ by (3.1.2) and (3.1.3).

3.2. R-matrix for multiple tensor products. For the sake of simplicity, let us denote $V_x = \Phi_x(\mathcal{Q}(q)[x, x^{-1}] \otimes \mathcal{Q}(q))$. Then the R-matrix $R$ gives a $U_q'(g)$-linear map $V_x \otimes V_y \rightarrow V_y \otimes V_x$. We denote it by $R(x, y)$. Note that $R(x, y)$ depends only on $x/y$. Let $l$ be a positive integer and $\mathcal{S}_l$ the $l$th symmetric group. Let $s_i$ be the simple reflection (the permutation of $i$ and $i + 1$) and let $l(w)$ denote the length of $w \in \mathcal{S}_l$. Then for any $w \in \mathcal{S}_l$, we can define $R_w(x_1, \ldots, x_l): V_{s_1} \otimes \cdots \otimes V_{s_l} \rightarrow V_{s_{w(1)}} \otimes \cdots \otimes V_{s_{w(l)}}$ as follows:

(3.2.1) \[R_1(x_1, \ldots, x_l) = 1.\]

(3.2.2) \[R_s(x_1, \ldots, x_l) = (\otimes_{j<i} \text{id}_{V_{s_j}}) \otimes R(x_i, x_{i+1}) \otimes (\otimes_{j>i+1} \text{id}_{V_{s_j}}).\]

(3.2.3) \[\text{For } w, w' \text{ with } l(ww') = l(w) + l(w'), \]

\[R_{ww'}(x_1, \ldots, x_l) = R_w(x_{w(1)}, \ldots, x_{w(l)}) \circ R_w(x_1, \ldots, x_l).\]
3.3. Construction of \( V_l \) and \((V_l)_{\mathbb{K}^*}\). Fix \( r \in \mathbb{Z}_{>0} \). For each \( l \in \mathbb{Z}_{>0} \) we set

\[
R_l = R_{w_0}(q^{rl-1}, q^{rl-3}, \ldots, q^{-rl+1});
\]

\[
V_{q^{rl-1}} \otimes V_{q^{rl-3}} \otimes \cdots \otimes V_{q^{-rl+1}} \to V_{q^{-rl+1}} \otimes V_{q^{rl-3}} \otimes \cdots \otimes V_{q^{rl-1}}
\]

where \( w_0 \in \mathfrak{S}_l \) is the permutation given by \( i \mapsto l + 1 - i \). Then \( R_l \) is a \( U_q'(g) \)-linear homomorphism. We define

\[(3.3.1) \quad V_l = \text{Im } R_l.\]

Then \( V_l \) is an integrable \( U_q'(g) \)-module. We have

\[(3.3.2) \quad R_l(u_0^{\otimes l}) = \psi_l(q)u_0^{\otimes l}.\]

where

\[(3.3.3) \quad \psi_l(q) = \prod_{1 \leq i < j \leq l} \varphi(q^{2r(j-i)}).\]

Here \( \varphi \) is given by (3.1.6). Now we assume that

\[(3.3.4) \quad \varphi(q^{2kr}) \text{ does not vanish for any } k > 0.\]

We set

\[(3.3.5) \quad \tilde{R} = \psi_l(q)^{-1}R_l.\]

We define the \( \mathbb{K}^* \)-form of \( V_l \) by

\[(3.3.6) \quad (V_l)_{\mathbb{K}^*} = \tilde{R}((V_{\mathbb{K}^*}^{(l)})^{\otimes l}) \cap (V_{\mathbb{K}^*}^{(l)})^{\otimes l}.\]

Then \( (V_l)_{\mathbb{K}^*} \) is a \( U_q'(g)_{\mathbb{K}^*} \)-submodule of \( V_l \) such that \( Q(q) \otimes (V_l)_{\mathbb{K}^*} = V_l. \) If we set \( u_l = u_0^{\otimes l} \), then \( (V_l)_{\mathbb{K}^*} \ni u_l. \) We have

\[(3.3.7) \quad (V_l)_{l\lambda_0} = Q(q)u_l,\]

\[(3.3.8) \quad \text{the weights of } V_l \text{ are contained in } l\lambda_0 + \sum_{i \neq i_0} \mathbb{Z}_{\leq 0} \alpha_i.\]

Let us denote by \( W \) the image of

\[R(q^r, q^{-r}) : V_q \otimes V_{q^{-r}} \to V_{q^{-r}} \otimes V_q.\]
and by $K$ its kernel. For each $i$, $R_i$ decomposes as

$$V_{q^{r(t-1)}} \otimes \cdots \otimes V_{q^{r(t-2+i)}} \to \cdots \otimes V_{q^{r(t-2+i-2)}} \otimes V_{q^{r(t-2+i-1)}}$$

$$\otimes V_{q^{r(t-2+i-1)}} \cdots \otimes R(q^{r(t-2+i-1)}, q^{r(t-2+i)}) \otimes \cdots \to V_{q^{r(t-1)}} \otimes \cdots \otimes V_{q^{r(t-1)}}.$$

Therefore,

(3.3.9) $V_i$ considered as a submodule of $V^{\otimes i} = V_{q^{r(t-1)}} \otimes \cdots \otimes V_{q^{r(t-1)}}$

is contained in $\bigcap_{i=0}^{l-2} V^{\otimes i} \otimes W \otimes V^{\otimes (l-2-i)}$.

Similarly, we have

(3.3.10) $V_i$ is a quotient of $V^{\otimes i}/\bigoplus_{i=0}^{l-2} V^{\otimes i} \otimes K \otimes V^{\otimes (l-2-i)}$.

3.4. Polarization on $V_i$. Now we shall define the polarization on $V_i$. The following is immediate.

**Lemma 3.4.1.** Let $M_j$ and $N_j$ be $U_q'(\mathfrak{g})$-modules and let $(\ , \ )_j$ be an admissible pairing between $M_j$ and $N_j$ ($j = 1, 2$). Then the pairing $(\ , \ )$ between $M_1 \otimes M_2$ and $N_1 \otimes N_2$ defined by $(u_1 \otimes u_2, v_1 \otimes v_2) = (u_1, v_1)(u_2, v_2)$ for all $u_j \in M_j$ and $v_j \in N_j$ is admissible.

The polarization on $V$ gives an admissible pairing between $V_{x_1}$ and $V_{x_1}$. Hence it induces an admissible pairing between $V_{x_1} \otimes \cdots \otimes V_{x_1}$ and $V_{x_1} \otimes \cdots \otimes V_{x_1}$.

**Lemma 3.4.2.** If $x_j = x_{i+1-j}$ for $j = 1, \ldots, l$, then for any $u, u' \in V_{x_1} \otimes \cdots \otimes V_{x_l}$, we have

$$(u, R_{w_0}(x_1, \ldots, x_l)u') = (u', R_{w_0}(x_1, \ldots, x_l)u).$$

**Proof.** If $x_1 = 1$ for all $j$, $V_{x_1} \otimes \cdots \otimes V_{x_1}$ is an irreducible $U_q'(\mathfrak{g})$-module by Lemma 3.4.4 and Corollary 4.6.3 in [KMN²]. Hence Lemma 3.4.2 in [KMN²] implies that $V_{x_1} \otimes \cdots \otimes V_{x_1}$ is an irreducible $U_q'(\mathfrak{g})$-module for generic $x_1, \ldots, x_l$. Hence it is enough to check it for $u = u' = u$. This is obvious. □

By taking $x_1 = q^{r(t-1)}$, $x_2 = q^{r(t-3)}$, etc., we obtain the admissible pairing $(\ , \ )$ between $W = V_{q^{r(t-1)}} \otimes V_{q^{r(t-3)}} \otimes \cdots \otimes V_{q^{r(t-l-1)}}$ and $W' = V_{q^{r(t-1)}} \otimes V_{q^{r(t-3)}} \otimes \cdots \otimes V_{q^{r(t-l-1)}}$ that satisfies

(3.4.1) $$(w, \tilde{R}w') = (w', \tilde{R}w) \quad \text{for any } w, w' \in W.$$

This allows us to define a prepolarization $(\ , \ )_i$ on $V_i$ by

(3.4.2) $$(\tilde{R}_i u, \tilde{R}_i u')_i = (u, \tilde{R}_i u')$$
for \(u, u' \in V_{q_n^{(1)}} \otimes V_{q_{n-1}}^{(1)} \otimes \cdots \otimes V_{q_1^{(1)}}\). Since the pairing \( \langle \ , \ \rangle \) between \(W\) and \(W'\) is nondegenerate, we obtain the following proposition.

**Proposition 3.4.3.** (i) \( \langle \ , \ \rangle \) is a nondegenerate prepolarization on \(V_i\).

(ii) \( \langle \tilde{R}(u), \tilde{R}(u) \rangle_i = 1 \).

(iii) \( \langle (V_i)_{K^q}, (V_i)_{K^q} \rangle_i \subseteq K^q \).

Then by applying Proposition 2.6.2 (with \(m = 1\)) and Proposition 2.6.1, we obtain the following result.

**Proposition 3.4.4.** Set \(I_0 = I \setminus \{i_0\}\). If \(V_i\) is an irreducible \(U_q(g_{I_0})\)-module, then the \(U_q^*\)-module \(V_i\) admits a crystal pseudobase.

Similarly, we have the following result.

**Proposition 3.4.5.** Let \(m\) be a positive integer and assume the following conditions:

(i) \(\langle h_i, \lambda_0 + j\alpha_{i_0} \rangle \geq 0\) for \(i \neq i_0\) and \(0 \leq j \leq m\).

(ii) \(\dim(V_i)_{\lambda_0 + k\alpha_{i_0}} \leq \sum_{j=0}^{m} \dim V(\lambda_0 + j\alpha_{i_0})_{\lambda_0 + k\alpha_{i_0}}\) for \(0 \leq k \leq m\), where \(V(\lambda)\) is an irreducible \(U_q^*\)-module with highest weight \(\lambda\).

(iii) There exists \(i_1 \in I\) such that \(\{i \in I | \langle h_i, \alpha_i \rangle < 0\} = \{i_1\}\).

(iv) \(-\langle h_{i_0}, \lambda_0 - \alpha_{i_0} \rangle \geq 0\).

Then we have

\[
V_i \cong \bigoplus_{j=0}^{m} V(\lambda_0 + j\alpha_{i_0}) \quad \text{as a } U_q(g_{I_0})\text{-module},
\]

and \(V_i\) admits a crystal pseudobase as a \(U_q^*\)-module.

**Proof.** It is enough to show

\[
(3.4.3) \quad (e_i^{(k)}u, e_i^{(k)}u) \in 1 + qA \quad \text{for } 0 \leq k \leq m,
\]

\[
(3.4.4) \quad (e_i e_i^{(k)}u, e_i e_i^{(k)}u) \in q d_i^{-1(1 + \langle h_i, \lambda_0 + k\alpha_{i_0} \rangle)} A
\]

for \(0 \leq k \leq m\) and \(i \in I_0\). In fact, by applying Proposition 2.6.2 to the \(U_q(g_{I_0})\)-module \(V_i\), we can show that it is isomorphic to \(\bigoplus_{j=0}^{m} V(\lambda_0 + j\alpha_{i_0})\). Moreover, if we define \(L\) and \(B\) as in Proposition 2.6.2, then \((L, B)\) is a crystal pseudobase of the \(U_q(g_{I_0})\)-module \(V_i\) and the induced symmetric bilinear form on \(L/qL\) is positive definite. Then Proposition 2.6.1 implies the desired result.

In the following, we use

\[
\begin{bmatrix}
a \\
b
\end{bmatrix} \in q^{-b(a-b)}(1 + qA), \quad [a] \in q^{1-a}A \quad \text{for } a, b \geq 0.
\]

Since \(cl(-\alpha_{i_0}) = cl(\delta - \alpha_{i_0}) \in \sum_{i \neq i_0} Z_{\geq 0} cl(\alpha_i)\) and the weights of \(V_i\) are contained in
$l \lambda_0 + \sum_{i \neq i_0} \mathbb{Z}_{\leq 0} \text{cl}(z_i)$, we obtain $f_{i_0} u_t = 0$. Therefore we have

$$\tag{3.4.5} (e^{(k)}_{i_0} u_t, e^{(k)}_{i_0} u_t) = q^{k < h_{i_0}, l \lambda_0 >}_{k} \left[ - \langle \lambda_{i_0}^*, l \lambda_0 \rangle \right]_0.$$  

From this follows (3.4.3).

Let us prove (3.4.4). For notational simplicity we shall write 0 or 1 instead of $i_0$ or $i_1$. If $i \neq 0, 1$, we have

$$\tag{3.4.6} e_i e^{(k)}_{0} u_t = e^{(k)}_{0} e_i u_t = 0$$

If $i = 1$, we have

$$\tag{3.4.7} (e_1 e^{(k)}_{0} u_t, e_1 e^{(k)}_{0} u_t) = (v, u_t)_l$$

where

$$v = q^{-k^2} q_1^{-1} f_0^{-1} e_1 e^{(k)}_{0} u_t.$$  

Now, by setting $\mu = l \lambda_0$, we have

$$\tag{3.4.8} v = q^{-k(\langle h_0, \mu \rangle + k)} q_1^{-1} f_0^{-1} e_1 e^{(k)}_{0} u_t$$

On the other hand, $f_1 e_1 = e_1 f_1 - \{ t_1 \}_1$ implies

$$\tag{3.4.9} f^{(k)}_0 f_1 e_1 e^{(k)}_{0} u_t = f^{(k)}_0 (e_1 f_1 - \{ t_1 \}_1) e^{(k)}_{0} u_t$$

$$= e_1 f^{(k)}_0 e_0^{(k)} f_1 u_t - [\langle h_1, \mu + k z_0 \rangle]_1 f^{(k)}_0 e_0^{(k)} u_t.$$  

Similarly to $f_0 u_t = 0$, we have $f_0 f_1 u_t = 0$. Hence

$$f^{(k)}_0 e^{(k)}_{0} f_1 u_t = \left[ - \langle h_0, \mu - \alpha_1 \rangle \right]_0 f_1 u_t.$$  

Thus we obtain

$$\tag{3.4.10} e_1 f^{(k)}_0 e^{(k)}_{0} f_1 u_t = \left[ - \langle h_0, \mu - \alpha_1 \rangle \right]_0 e_1 f_1 u_t$$

$$= [\langle h_1, \mu \rangle]_1 \left[ - \langle h_0, \mu - \alpha_1 \rangle \right]_0 u_t.$$
Comparing (3.4.7–3.4.10), we have

\[ (e_1 e_0^{(k)} u_i, e_1 e_0^{(k)} u_i)_h = q_0^{k(\langle h_0, h \rangle - k)} q_1^{-1 - \langle h_1, \mu + k\alpha_0 \rangle} \]

\[ \times \left( \frac{\langle h_1, \mu \rangle}{k} \right)_1^{\langle h_0, \mu - \alpha_1 \rangle} - \frac{\langle h_1, \mu + k\alpha_0 \rangle}{k} \right) \).

Since \((\alpha_0, \alpha_0) \langle h_0, \alpha_1 \rangle = (\alpha_1, \alpha_1) \langle h_1, \alpha_0 \rangle\), we have

\[ (\alpha_1, \alpha_1)(1 - \langle h_1, \mu \rangle) - (\alpha_0, \alpha_0)k(-\langle h_0, \mu - \alpha_1 \rangle - k) \]

\[ = (\alpha_1, \alpha_1)(1 - \langle h_1, \mu + k\alpha_0 \rangle) - (\alpha_0, \alpha_0)k(-\langle h_0, \mu \rangle - k), \]

and the sum of this and

\[ (\alpha_0, \alpha_0)k(-\langle h_0, \mu \rangle - k) + (\alpha_1, \alpha_1)(1 - \langle h_1, \mu + k\alpha_0 \rangle) \]

becomes \(-2(\alpha_1, \alpha_1) \langle h_1, \mu + k\alpha_0 \rangle\). Hence \((e_1 e_0^{(k)} u_i, e_1 e_0^{(k)} u_i) \in q_1^{-2(\langle h_1, \mu + k\alpha_0 \rangle)} A. \]

4. Constructions of level-one representations. In the following we calculate the explicit forms of \(R\)-matrices. Except in the case of \((\text{D}_{n+1}^{(2)}, V^1)\), all nonzero weight spaces of the representations which we treat here are one-dimensional. So we denote by \(b\) the lower global base corresponding to an element \(b\) of the crystal of a representation except in the case of \((\text{D}_{n+1}^{(2)}, V^1)\). In Sections 4.1–4.9 we denote by \(t\) the Cartan subalgebra of \(g\), by \(\{\alpha_i | i \in I\} \subset t^*\) the set of simple roots, by \(\{h_i | i \in I\} \subset t\) the set of simple coroots and by \(\{\Lambda_i | i \in I\}\) the set of fundamental weights of the corresponding Lie algebras, where \(I = \{0, 1, \ldots, n\}\). We assume that the norm of a short root is equal to one. For any finite-dimensional \(U_q(g)\)-module \(W\) and the choice of \(i_0\), we set \(W_x = \Phi_{(\mathbf q)} (\mathbf Q(q)[x, x^{-1}] \otimes_{\mathbf Q(q)} W)\). The calculations of the \(R\)-matrices here are carried out in the following manner. For a finite-dimensional \(U_q(g)\)-module \(W\) and the choice of \(i_0\), we first decompose \(W \otimes W\) into the direct sum \(\bigoplus_{j \in J} W_j\) of irreducible \(U_q(g)_{\Pi(x)}\)-modules. Then the \(R\)-matrix \(R(x/y)\): \(W_x \otimes W_y \to W_y \otimes W_x\) can be written as \(R(x/y) = \bigoplus_{j} \gamma_j(x/y) P_{W_j}\) by Schur’s lemma, where \(P_{W_j}\) is the \(U_q(g)_{\Pi_{(i_{0})}}\)-linear projection from \(W_x \otimes W_y\) to \(W_j\). Let \(w_i\) be the highest-weight vector of \(W_j\). Except in the case of Section 4.8, we find elements \(P_i\) of \(U_q(g)\) and \(\beta_i(x, y)\) of \(\mathbf Q(q)[x, x^{-1}, y, y^{-1}]\) which satisfy \(P_i w_i = \beta_i(x, y) w_{i+1}\) in \(W_x \otimes W_y\) for an appropriate order of \(J\). Then we have recursion relations

\[ \gamma_j(x/y) \beta_{i+1}(y, x) = \beta_i(x, y) \gamma_{i+1}(x/y). \]

From these relations we can determine \(\gamma_j(x/y)\) for all \(j \in J\) up to a multiple of an element of \(\mathbf Q(q)(x/y)\).
4.1. \((A^{(1)}_n, V^k)\). Let \(\mathfrak{g} = \widehat{\mathfrak{sl}(n + 1)}\) be the affine Lie algebra of type \(A^{(1)}_n\). Define \(\widetilde{\Lambda}_i (i \in \mathbb{Z})\) by

\[
\widetilde{\Lambda}_i = \begin{cases} 
\Lambda_i & \text{for } 1 \leq i \leq n, \\
0 & \text{otherwise}.
\end{cases}
\]

We assume that \((\langle h_i, \alpha_j \rangle)_{1 \leq i, j \leq n}\) is the Cartan matrix of type \(A_n\). We set \(i_0 = 0\). Let \(U_q(\widehat{\mathfrak{sl}(n + 1)})\) be the subalgebra of \(U_q(\widehat{\mathfrak{sl}(n + 1)})\) associated with \(\{h_i, \alpha_j | 1 \leq i, j \leq n\}\).

4.1.1. Decomposition of the tensor product. Let \(V(\Lambda_k)(1 \leq k \leq n)\) be the irreducible highest-weight \(U_q(\widehat{\mathfrak{sl}(n + 1)})\)-module with highest weight \(\Lambda_k\) and \((L(\Lambda_k), B(\Lambda_k))\) its crystal base. By [KN] the elements of \(B(\Lambda_k)\) are labeled in the following way.

\[
B(\Lambda_k) = \{(m_i)_{i=1}^k | 1 \leq m_1 < \cdots < m_k \leq n + 1\}.
\]

Then

\[
V(\Lambda_k) \otimes V(\Lambda_k) \simeq \bigoplus_{i=0}^{\min(n+1-k,k)} V(\widetilde{\Lambda}_{k-i} + \widetilde{\Lambda}_{k+i}).
\]

The highest-weight elements for the corresponding crystals are given by

\[
(i_{k-1}^{i_0} \otimes (1, \ldots, k - i, k + 1, \ldots, k + i) \text{ for } B(\widetilde{\Lambda}_{k-i} + \widetilde{\Lambda}_{k+i}).
\]

4.1.2. Construction of the representation of \(U_q(\widehat{\mathfrak{sl}(n + 1)})\). Define the actions of \(e_0\) and \(f_0\) on \(V(\Lambda_k)\) by

\[
f_0 b = \begin{cases} (1, i_1, \ldots, i_{k-1}) & \text{if } b = (i_1, \ldots, i_{k-1}, n + 1) \\
0 & \text{otherwise},
\end{cases}
\]

\[
e_0 b = \begin{cases} (j_1, \ldots, j_{k-1}, n + 1) & \text{if } b = (1, j_1, \ldots, j_{k-1}) \\
0 & \text{otherwise}.
\end{cases}
\]

It is easily verified that \(V(\Lambda_k)\) is a well-defined \(U_q(\widehat{\mathfrak{sl}(n + 1)})\)-module with the actions of \(e_0, f_0\) given above and \(q^{h_0} = q^{-(h_1 + \cdots + h_n)}\). We denote this \(U_q(\widehat{\mathfrak{sl}(n + 1)})\)-module by \(V^k\). By the construction it is obvious that \(V^k\) has a crystal base.

4.1.3. Construction of a polarization of \(V^k\). Let \((\ , \ )\) be the polarization of the \(U_q(\widehat{\mathfrak{sl}(n + 1)})\)-module \(V(\Lambda_k)\). We shall show

\[
(q^{h_0}u, v) = (u, q^{h_0}v),
\]

\[
(e_0 u, v) = (u, q_0^{-1}t_0^{-1}f_0 v),
\]

\[
(f_0 u, v) = (u, q_0^{-1}t_0 e_0 v),
\]
for any $u,v \in V^k$. It is sufficient to prove (4.1.2)–(4.1.4) for the lower global bases $u$ and $v$. The equality (4.1.2) is obvious by the definition of the action of $q^{h_0}$. By direct calculations we have the following lemma.

**Lemma 4.1.2.** (1) Let $b$ be a global base which satisfies $e_ib = 0$ and $\langle h_i, wt(b) \rangle = 1$. Then $(b, b) = (f_i b, f_i b) = (f_i^{(2)} b, f_i^{(2)} b) = q_i^{-1} [2]_i^{-1}(f_i b, f_i b)$.

(2) Let $b$ be a global base which satisfies $e_i b = 0$ and $\langle h_i, wt(b) \rangle = 2$. Then $(b, b) = (f_i^{(2)} b, f_i^{(2)} b) = q_i^{-1} [2]_i^{-1}(f_i b, f_i b)$.

Note that, for any $b \in B(\Lambda_k)$ and $i (1 \leq i \leq n)$, $q_i(b) + e_i(b) \leq 1$. Hence, by using Lemma 4.1.2, (4.1.2)–(4.1.4) are verified for lower global bases $u$ and $v$. Consequently, $(\ , \ )$ is a polarization of $U_q(\widehat{\mathfrak{sl}(n + 1)})$-module $V^k$.

### 4.1.4. Calculation of the R-matrix.

By the decomposition (4.1.1), $R(x/y)$ can be written as $R(x/y) = \bigoplus_{i=0}^{\min(n+1-k, k)} P_{(\ell_{k-i}+\ell_{k+i})}$, where $P_{(\ell_{k-i}+\ell_{k+i})}$ is the projection $P_{(\ell_{k-i}+\ell_{k+i})}: V(\Lambda_k) \otimes V(\Lambda_k) \to V(\Lambda_{k-i} + \Lambda_{k+i})$. Let $u_i(0 \leq i \leq \min(n+1-k, k))$ be the highest-weight vector in the $U_q(\mathfrak{sl}(n + 1))$-module $V(\Lambda_k) \otimes V(\Lambda_k)$ with highest weight $\Lambda_{k-i} + \Lambda_{k+i}$. We set $P_i = f_0 f_{n-i} \cdots f_{k+i} f_k \cdots f_{k-i}$. Then

**Lemma 4.1.3.** Let $v_{i-1} = P_i u_i (1 \leq i \leq \min(n+1-k, k))$. Then $v_{i-1}$ is nonzero and is proportional to $u_{i-1}$.

**Proof.** If $x = y = 1$, $v_{i-1} \neq 0$ in $L/qL$. Hence $v_{i-1} \neq 0$. By a direct calculation the weight of $v_{i-1}$ is $\Lambda_{k-i} + \Lambda_{k+i}$. We must check that $v_{i-1}$ is a highest-weight vector. Since $[e_r f_i] = 0$ for $r \neq i$, $e_r v_{i-1} = 0$ for $k-i < r < k+i$. As is immediately seen, the following set of vectors is the base of the weight space of $V(\Lambda_k) \otimes V(\Lambda_k)$ with weight $\Lambda_{k-i} + \Lambda_{k+i}$.

$$\{(1, \ldots, k-i, m_1, \ldots, m_i) \otimes (1, \ldots, k-i, l_1, \ldots, l_i) | \{m_1, \ldots, m_i\} \cup \{l_1, \ldots, l_i\}\}$$

$$= \{k-i+1, \ldots, k+i\}.$$

It follows that $e_r v_{i-1} = 0$ for $r < k-i$ and $r > k+i$. 

Let us define $b_1^{(0)}$ and $b_2^{(0)}$ by

$$b_1^{(0)} = (j)_{j=1}^k \otimes (1, 2, \ldots, k-i, k+1, \ldots, k+i),$$

$$b_2^{(0)} = (1, \ldots, k-i, k-i+2, \ldots, k, k+i) \otimes (1, \ldots, k-i+1, k+1, \ldots, k+i-1).$$

For any element $v$ of $V^k \otimes V^k$ we write $P_v v = \sum_p P_v^{p} b^{p}$, where $b^{p}$ runs over the set of tensor products of global bases of $V^k$. In the following subsections we use these notations in a similar way. The following lemma is by direct calculation, and we leave it to the reader.
**Lemma 4.1.4.** Let $b$ be an element of $V^k \otimes V^k$ which is a tensor product of two global bases of $V^k$ and has the weight $\Lambda_{k-i} + \Lambda_{k+i}$. Then $P_2^{(i,j)} \neq 0$ if and only if $b = b^{(0)}$. Moreover, $P_1 b^{(0)} = q^{-1} y^{-1} b^{(i-1)}$ and $P_2 b^{(0)} = x^{-1} b^{(i+1)}$.

**Lemma 4.1.5.** If we write $u_i = b^{(i)}_1 + \sum_k a_k b$, then $a_{b^{(0)}_2} = -q^{2i-1}$.

**Proof.** Let $b_{m_1, \ldots, m_i} = (1, \ldots, k-i, m_1, \ldots, m_i) \otimes (1, \ldots, k-i, l_1, \ldots, l_i)$, where $\{m_1, \ldots, m_i\} \cup \{l_1, \ldots, l_i\} = \{ j | k-i < j \leq k+i \}$. Note that $b^{(i)}_1 = b_{k-i+1, \ldots, k}$ and $b^{(0)}_2 = b_{k-i+2, \ldots, k, k+i}$. We write $a_b$ instead of $a_{b_\alpha}$ for $\alpha = (m_1, \ldots, m_i)$. There are relations

$$e_k (b_{k-i+1, \ldots, k} - q b_{k-i+1, \ldots, k-1, k+1}) = 0,$$

$$e_k (b_{k-i+1, \ldots, k, k-j+2, \ldots, k+1} - q b_{k-i+1, \ldots, k-j+1, k-1, k-j+1, \ldots, k+1}) = 0$$

for $1 \leq j \leq i-2$,

$$e_k (b_{k-i+1, k-i+3, \ldots, k+1} - q b_{k-i+2, \ldots, k+1}) = 0,$$

$$e_{k+1} (b_{k-i+2, \ldots, k, k+j} - q b_{k-i+2, \ldots, k, k+j+1}) = 0$$

for $1 \leq j \leq i-1$.

Since all the weight spaces of $V^k$ are one-dimensional and each length of $j$-strings ($1 \leq j \leq n$) is at most 1, $e_r u_i = 0$ for all $r$ implies

$$a_{k-i+1, \ldots, k-1, k+1} = -q,$$

$$a_{k-i+1, \ldots, k-j+2, \ldots, k+1} \cdot a_{k-i+1, \ldots, k-j+1, k-1, k-j+1, \ldots, k+1} = 1: -q$$

for $1 \leq j \leq i-2$,

$$a_{k-i+1, k-i+3, \ldots, k+1} \cdot a_{k-i+2, \ldots, k+1} = 1: -q,$$

$$a_{k-i+2, \ldots, k, k+j} \cdot a_{k-i+2, \ldots, k, k+j+1} = 1: -q$$

for $1 \leq j \leq i-1$.

It follows that $a_{b^{(0)}_2} = -q^{2i-1}$.

By these lemmas we have in $V^k \otimes V^k$

$$P_i u_i = q^{-1} x^{-1} y^{-1} (x - q^{2i} y) u_{i-1}.$$  

From this

$$t_i / t_{i-1} = x - q^{2i} y / y - q^{2i} x$$

for $1 \leq i \leq \min(n + 1 - k, k)$.

So we have proved the following result.
Proposition 4.1.6. Let \( z = xy^{-1} \). The R-matrix, up to a multiple of an element of \( Q(q)z \), is of the form

\[
R(z) = \bigoplus_{r=0}^{\min(n+1-k, k)} \prod_{i=1}^{r} (z - q^{2i}) \prod_{j=r+1}^{\min(n+1-k, k)} (1 - q^{2j}z) P_{\tilde{\lambda}_{k-r+r}}.
\]

4.2. (\( C_n^{(1)}, V^n \)). Let \( \mathfrak{g} = \hat{\mathfrak{sp}}(n) \) be the affine Lie algebra of type \( C_n^{(1)} \). We assume that \( \{ h_i, \alpha_j \}_{1 \leq i, j \leq n} \) is the Cartan matrix of type \( C_n \). We set \( i_0 = 0 \). Let \( U_q(\mathfrak{sp}(n)) \) be the subalgebra of \( U_q(\hat{\mathfrak{sp}}(n)) \) associated with \( \{ h_i, \alpha_j \}_{1 \leq i, j \leq n} \). In this case \( q_0 = q_n = q^2 \) and \( q_i = q (i \neq 0, n) \).

4.2.1. Decomposition of the tensor product. Let \( V(\Lambda_n) \) be the irreducible highest-weight \( U_q(\mathfrak{sp}(n)) \)-module with highest weight \( \Lambda_n \) and \( (L(\Lambda_n), B(\Lambda_n)) \) its crystal base. By \([KN]\) the elements of \( B(\Lambda_n) \) are labeled in the following way.

\[
B(\Lambda_n) = \{ (m_i)_{i=1}^n | m_1 < \cdots < m_n, m_i \in \{ 1, \ldots, n, \overline{n}, \ldots, \overline{1} \}, \]
\[
i + (n - j + 1) \leq m_i \text{ if } m_i = \overline{m}_j (i < j),
\]

where the ordering of \( \{ 1, \ldots, n, \overline{n}, \ldots, \overline{1} \} \) is given by

\[
1 < 2 < \cdots < n < \overline{n} < \cdots < \overline{1}.
\]

Then

\[(4.2.1) \quad V(\Lambda_n) \otimes V(\Lambda_n) \simeq V(2\Lambda_n) \oplus V(2\Lambda_{n-1}) \oplus \cdots \oplus V(2\Lambda_1) \oplus V(0),\]

where \( V(0) \) is the trivial representation. The highest-weight elements for the corresponding crystals are given by

\[
(\sum_{i=1}^n i \delta_i) \otimes (1, \ldots, i, \overline{n}, \ldots, \overline{1} + 1) \quad \text{for } B(2\Lambda_1),
\]

\[
(\sum_{i=1}^n i \delta_i) \otimes (\overline{n}, \overline{n-1}, \ldots, \overline{1}) \quad \text{for } B(0).
\]

4.2.2. Construction of the representation of \( U_q(\hat{\mathfrak{sp}}(n)) \). First, we prove the following lemma.

Lemma 4.2.1. Let \( V(\Lambda_n) \) denote the weight space of \( V(\Lambda_n) \) of the weight \( \lambda \). Then \( \dim V(\Lambda_n)_{\lambda} = 1 \) for any \( \lambda \).

Proof. Suppose that \( V(\Lambda_n)_{\lambda} \neq \{ 0 \} \). Let \( \lambda = \sum_{i=1}^n \xi_i \delta_i \) and \( S = \{ i | \xi_i \neq 0 \} \). Since there is an element \( b \in B(\Lambda_n)_{\lambda} \), \( \# S = n - 2k \) for some integer \( k \geq 0 \). For \( k = 0 \), \( \dim V(\Lambda_n)_{\lambda} = 1 \) is obvious. So we assume \( k \geq 1 \). Take any \( b \in B(\Lambda_n)_{\lambda} \). Then there is a set of integers \( (j_1, \ldots, j_k) \) which satisfies the following two conditions.

(1) \( 1 < j_1 < j_2 < \cdots < j_k \leq n \).

(2) \( b \) contains \( j_i \) and \( \overline{j}_i \) for \( 1 \leq i \leq k \).
Take any \((j_1, \ldots, j_k)\) which satisfies (1) and (2). Set \(l = \# \{ p \in S \mid p < j_k \}\). Since \(j_1 \geq 2\), \(j_k \geq 2k + l\), and hence \(n - j_k \leq n - 2k - l\). By the definition of \(l\), \(n - j_k\) must be equal to \(n - 2k - l\). Then the following properties must be hold.

(3) If \(l_p = \# \{ i \in S \mid j_p < i < j_{p+1} \}\), then \(j_{p+1} = j_p + 2 + l_p\).

(4) If \(l_0 = \# \{ i \in S \mid i < j_1 \}\), then \(j_1 = l_0 + 2\).

(5) If \(S \cup \{ j_1, \ldots, j_k \} = \{ r_i (1 \leq i \leq n - k) \mid r_i < r_{i+1} (1 \leq i \leq n - k - 1) \}\), then \(\{ i \mid r_{i+1} - r_i > 2, r_{i+1} \leq j_k \} = \emptyset\).

It follows that the set \(\{ j_1, \ldots, j_k \}\) is uniquely determined by \(S\) and hence by \(\lambda\). \(\square\)

Define the actions of \(e_0\) and \(f_0\) on \(V(\Lambda_n)\) by

\[

e_0 b = \begin{cases} 
(1, i_1, \ldots, i_{n-1}) & \text{if } b = (i_1, \ldots, i_{n-1}, \bar{1}) \\
0 & \text{otherwise},
\end{cases}
\]

\[
f_0 b = \begin{cases} 
(j_1, \ldots, j_{n-1}, \bar{1}) & \text{if } b = (1, j_1, \ldots, j_{n-1}) \\
0 & \text{otherwise}.
\end{cases}
\]

It is easily verified that \(V(\Lambda_n)\) is a well-defined \(U_q^{\text{(\hat{sp}(n))}}\)-module with these actions of \(e_0, f_0\) given above and \(q^{h_0} = q^{-(h_1 + \cdots + h_0)}\). We denote this \(U_q^{\text{(\hat{sp}(n))}}\)-module by \(V^n\).

4.2.3. Construction of a polarization of \(V^n\). Let \((\ , \ )\) be the polarization of the \(U_q(\text{sp}(n))\)-module \(V(\Lambda_n)\). Let us prove (4.1.3). Set \(b_{\Lambda_n} = (1, 2, \ldots, n)\). Then

\[
f_1^{(2)} \cdots f_{n-1}^{(2)} f_n b_{\Lambda_n} = (2, \ldots, n, \bar{1}) = e_0 b_{\Lambda_n}.
\]

Let \(b = (1, j_1, \ldots, j_{n-1})\). Then \(b\) and \(e_0 b\) can be written as

\[

b = f_{i_1}^{(n_k)} \cdots f_{i_k}^{(n_1)} b_{\Lambda_n},
\]

\[
e_0 b = f_{i_1}^{(n_k)} \cdots f_{i_1}^{(n_1)} e_0 b_{\Lambda_n},
\]

where \(i_1, \ldots, i_k \in \{ 2, \ldots, n \}\) and \(n_i \in \{ 1, 2 \} (1 \leq i \leq k)\). By Lemma 4.1.2 and (4.2.2), \((b_{\Lambda_n}, b_{\Lambda_n}) = (e_0 b_{\Lambda_n}, e_0 b_{\Lambda_n})\). Hence it follows from Lemma 4.1.2, (4.2.3), (4.2.4), and the commutativity of \(e_0\) with \(e_i (i \neq 1), f_j (j \neq 0)\) that \(b, b\) is a polarization of the \(U_q^{\text{(\hat{sp}(n))}}\)-module \(V^n\). \(\square\)

4.2.4. Calculation of the \(R\)-matrix. By the decomposition (4.2.1), \(R(x/y)\) can be written as \(R(x/y) = \sum_{i=1}^{n} c_i \gamma_i P_{2\Lambda_i} \oplus \gamma_0 P_0\), where \(P_{2\Lambda_i}\) and \(P_0\) are the projections \(P_{2\Lambda_i} : V(\Lambda_n) \otimes V(\Lambda_n) \to V(2\Lambda_i)\) and \(P_0 : V(\Lambda_n) \otimes V(\Lambda_n) \to V(0)\) respectively. Let \(u_{2\Lambda_i}\)}
(1 ≤ i ≤ n) and \( u_0 \) be the highest-weight vectors in the \( U_q(\mathfrak{sp}(n)) \)-module \( V(\Lambda_n) \otimes V(\Lambda_n) \) with weights \( 2\Lambda_i \) and 0 respectively.

We set \( f_0 f_1^{(2)} \cdots f_i^{(2)} \). Let us define \( b_1^{(i)} \) and \( b_2^{(i)} \) by

\[
b_1^{(i)} = (j)_{j=1}^i \otimes (1, \ldots, i, \bar{n}, \ldots, \bar{i} + 1),
b_2^{(i)} = (1, \ldots, i, i + 2, \ldots, n, \bar{i} + 1) \otimes (1, \ldots, i + 1, \bar{n}, \ldots, \bar{i} + 2).
\]

The proofs of the following lemmas are similar to those of Lemma 4.1.3 and Lemma 4.1.4.

**Lemma 4.2.3.** Let \( u_{i+1} = P_i u_{2\Lambda_i} \). Then \( u_{i+1} \) is nonzero and is proportional to \( u_{2\Lambda_i+1} \).

**Lemma 4.2.4.** Let \( b \) be an element of \( V^n \otimes V^n \) which is a tensor product of global bases and has weight \( 2\Lambda_i \). Set \( P_i b = \sum_{b'} F_{b'} b' \). Then \( F_{b^{(i+1)}} b \neq 0 \) if and only if \( b = b_1^{(i)} \) or \( b_2^{(i)} \). Moreover, \( P_i b_1^{(i)} = q^{-2} y^{-1} b_1^{(i+1)} \) and \( P_i b_2^{(i)} = x^{-1} b_2^{(i+1)} \).

**Lemma 4.2.5.** If we write \( u_{2\Lambda_i} = b_1^{(i)} + \sum_{b \neq b_1^{(i)}} a_b b \), then \( a_{b_2^{(i)}} = -q^{2(n-i)} \).

**Proof.** Let \( b_{m_1, \ldots, m_{n-1}} = (1, \ldots, i, m_1, \ldots, m_{n-1}) \otimes (1, \ldots, i, \bar{m}_{n-i}, \ldots, \bar{m}_1) \) with \( i < m_1 < \cdots < m_{n-1} < i \). Note that \( b_1^{(i)} = b_{i+1, \ldots, n} \) and \( b_2^{(i)} = b_{i+2, \ldots, i+1} \). We write \( a_\alpha \) instead of \( a_b \) for \( \alpha = (i, \ldots, m_{n-1}) \). Using the fact that all the weight spaces of \( V^n \) are one-dimensional and each length of \( j \)-strings (1 ≤ \( j \) ≤ n) is at most 2, in a similar manner as in the proof of Lemma 4.1.4, we have

\[
a_{i+1, \ldots, n-1, \bar{a}} = -q^2 a_{i+1, \ldots, j+2, \ldots, n, \bar{i+1}} a_{i+1, \ldots, j-1, i+1, \ldots, n, \bar{j+1}} a_{i+1, \ldots, j-1, i+1, \ldots, n, \bar{j}} = 1: -[2]_{-1} q^2.
\]

It follows that \( b_2^{(i)} = -q^{2(n-i)} \). \( \square \)

By Lemma 4.2.3–4.2.5 we have in \( V^n_x \otimes V^n_y \)

\[
P_i u_{2\Lambda_i} = q^{-2} x^{-1} y^{-1} (x - q^{2(n-i+1)}) u_{2\Lambda_{i+1}}^x y_{2\Lambda_{i+1}}^y,
\]

where \( u_{2\Lambda_i} (1 ≤ i ≤ n) \) and \( u_0 \) are supposed to be normalized as in Lemma 4.2.5. From this

\[
\frac{\gamma_i}{\gamma_{i+1}} = \frac{x - q^{2(n-i+1)} y}{y - q^{2(n-i+1)} x}
\]

for 0 ≤ i ≤ n − 1.

Consequently, we have the following result.

**Proposition 4.2.6.** Let \( z = xy^{-1} \). The \( R \)-matrix, up to a multiple of an element of \( Q(q)(z) \), is of the form

\[
R(z) = \sum_{j=0}^{n-1} \prod_{k=1}^{j} (z - q^{2(k+1)}) \prod_{i=j+1}^{n} (1 - q^{2(i+1)} z) P_{2\Lambda_{n-j}} \prod_{k=1}^{n} (z - q^{2(k+1)}) P_0.
\]
4.3. \((D_n^{(1)}, V^n)\). Let \(\mathfrak{g} = \widehat{\mathfrak{so}}(2n)\) be the affine Lie algebra of type \(D_n^{(1)}\). Define \(\widehat{\Lambda}_i (i \in \mathbb{Z})\) by

\[
\widehat{\Lambda}_i = \begin{cases} 
\Lambda_i & \text{for } 1 \leq i \leq n, \\
0 & \text{otherwise}.
\end{cases}
\]

We assume that \(\langle h_i, \alpha_j \rangle_{1 \leq i, j \leq n}\) is the Cartan matrix of type \(D_n\). We set \(i_0 = 0\). Let \(U_q(\mathfrak{so}(2n))\) be the subalgebra of \(U_q(\widehat{\mathfrak{so}}(2n))\) associated with \(\{h_i, \alpha_j\}_{1 \leq i, j \leq n}\).

4.3.1. Decomposition of the tensor product. Let \(V(\Lambda_n)\) be the irreducible highest-weight \(U_q(\mathfrak{so}(2n))\)-module with highest weight \(\Lambda_n\) and \((L(\Lambda_n), B(\Lambda_n))\) its crystal base. By [KN] the elements of \(B(\Lambda_n)\) are labeled in the following way.

\[
B(\Lambda_n) = \left\{ (m_1, \ldots, m_n) \bigg| m_i = + \text{ or } -m_i, \prod_{i=1}^n m_i = + \right\}.
\]

Let \(N_n\) be the largest integer which does not exceed \(\frac{n}{2}\). Then

\[(4.3.1) \quad V(\Lambda_n) \otimes V(\Lambda_n) \simeq \bigoplus_{i=0}^{N_n} V(\delta_{i0} \widehat{\Lambda}_n + \widehat{\Lambda}_{n-2i}).\]

The highest-weight elements for the corresponding crystals are given by

\[(+, \cdots, +) \otimes (+, \cdots, +, \cdots, +, - \cdots, -) \quad \text{for } B(\delta_{i0} \widehat{\Lambda}_n + \widehat{\Lambda}_{n-2i}).\]

4.3.2. Construction of the representation of \(U'_q(\widehat{\mathfrak{so}}(2n))\). Define the actions of \(e_0\) and \(f_0\) on \(V(\Lambda_n)\) by

\[
f_0b = \begin{cases} 
(+, +, i_1, \ldots, i_{n-2}) & \text{if } b = (-, -, i_1, \ldots, i_{n-2}) \\
0 & \text{otherwise},
\end{cases}
\]

\[
e_0b = \begin{cases} 
(-, -, j_1, \ldots, j_{n-2}) & \text{if } b = (+, +, j_1, \ldots, j_{n-2}) \\
0 & \text{otherwise}.
\end{cases}
\]

It is easily verified that \(V(\Lambda_n)\) is a well-defined \(U'_q(\widehat{\mathfrak{so}}(2n))\)-module with the actions of \(e_0, f_0\) given above and \(q^{h_0} = q^{-h_1-2(h_2+\cdots+h_{n-1})-h_n}\). We denote this \(U'_q(\widehat{\mathfrak{so}}(2n))\)-module by \(V^n\).

4.3.3. Construction of a polarization of \(V^n\). Let \((\ , \ )\) be the polarization of the \(U_q(\mathfrak{so}(2n))\)-module \(V(\Lambda_n)\). Note that for any \(b \in B(\Lambda_n)\) and \(i (1 \leq i \leq n)\), \(\phi_i(b) + e_i(b) \leq 1\). Hence, as in 4.1.3, \((\ , \ )\) is a polarization of \(U'_q(\widehat{\mathfrak{so}}(2n))\)-module \(V^n\).

4.3.4. Calculation of the \(R\)-matrix. By the decomposition (4.3.1), \(R(x/y)\) can be written as \(R(x/y) = \bigoplus_{i=1}^{N_n} \gamma_{n-2i} P(\delta_{i0}\widehat{\Lambda}_n + \widehat{\Lambda}_{n-2i})\), where \(P(\delta_{i0}\widehat{\Lambda}_n + \widehat{\Lambda}_{n-2i})\) is the projection.
$P_{(\delta_0 \tilde{\Lambda}_n + \tilde{\Lambda}_{n-2i})}: V(\Lambda_n) \otimes V(\Lambda_n) \rightarrow V(\delta_0 \tilde{\Lambda}_n + \tilde{\Lambda}_{n-2i})$. Let $u_{n-2i}(1 \leq i \leq N_n)$ be the highest-weight vector in the $U_q(\mathfrak{so}(2n))$-module $V(\Lambda_n) \otimes V(\Lambda_n)$ with the weight $\delta_0 \tilde{\Lambda}_n + \tilde{\Lambda}_{n-2i}$. We set $P_i = f_0 f_2 f_3 \cdots f_{n-2i+1} f_{i} f_{i-1} \cdots f_{n-2i+1}$. Let us define $b_{1}^{(0)}$ and $b_{2}^{(0)}$ by

$$b_{1}^{(0)} = (+, \cdots, +) \otimes (+, \cdots, +, -, \cdots, -),$$

$$b_{2}^{(0)} = (+, \cdots, +, -, -, +, +, \cdots, -) \otimes (+, \cdots, +, +, +, -, \cdots, -).$$

The proofs of the following two lemmas are similar to those of Lemma 4.1.3 and 4.1.4.

**Lemma 4.3.2.** The element $P_i u_{n-2i}(0 \leq i \leq N_n)$ is nonzero and is proportional to $u_{n-2(i-1)}$.

**Lemma 4.3.3.** Let $b$ be an element of $V^n \otimes V^n$ which is a tensor product of global bases and has the weight $\delta_0 \tilde{\Lambda}_n + \tilde{\Lambda}_{n-2i}$. Set $P_i b = \sum b_i^p b_i^r$. Then $F_{b_i^p}^{(i-1)} \neq 0$ if and only if $b = b_{1}^{(0)}$ or $b_{2}^{(0)}$. Moreover, $P_i b_{1}^{(0)} = q^{-1} y^{-1} b_{1}^{(i-1)}$ and $P_i b_{2}^{(0)} = x^{-1} b_{1}^{(i-1)}$.

**Lemma 4.3.4.** If we write $u_{n-2i} = b_{1}^{(0)} + \sum b_i a_i b_i$, then $a_{i}^{0} = -q^{4i-3}$.

**Proof.** Let us set $b_{n-j}^- = (+, \cdots, +, -, -, +, +, \cdots, +, -, \cdots, -, +, \cdots, +)$ and $b_{n-j}^+ = (+, \cdots, +, +, +, \cdots, +, +, +, \cdots, +) \otimes (+, \cdots, +, -, -, \cdots, -).$ By using

$$e_{n-j}(b_{n-j+1}^- - q b_{n-j}^-) = 0 \quad \text{for } 2 \leq j \leq 2i - 1,$$

$$e_{n-j}(b_{n-j+1}^+ - q b_{n-j}^+) = 0 \quad \text{for } 1 \leq j \leq 2i - 2,$$

$$e_{n}(b_{1}^{(0)} - q b_{1}^{-1}) = 0,$$

It is easily verified, in a similar way to the proof of Lemma 4.1.4, that $u_{n-2i}$ must be of the form

$$u_{n-2i} = b_{1}^{(0)} + \sum_{j=1}^{2i-1} (-1)^{j} q^{j} b_{n-j}^- + \sum_{j=1}^{2i-2} (-1)^{j-1} q^{2i-j-1} b_{n-j}^+$$

+ (terms without the elements of the global base already appeared).

Since $b_{2}^{(0)} = b_{n-2i+2},$, we have proved the lemma.

By these lemmas we have in $V_x^1 \otimes V_y^1$

$$P_i u_{n-2i} = q^{-1} x^{-1} y^{-1} (x - q^{4i-2} y) u_{n-2(i-1)}. \quad \square$$
From this
\[ \frac{\gamma_{n-2(i-1)}}{\gamma_{n-2i}} = \frac{y - q^{4i-2}x}{x - q^{4i-2}y} \quad \text{for } 1 \leq i \leq N_n. \]

So we have proved the following proposition.

**Proposition 4.3.5.** Let \( z = xy^{-1} \). The R-matrix, up to a multiple of an element of \( \mathbb{Q}(q)(z) \), is of the form

\[ R(z) = \bigoplus_{j=0}^{N_n} \prod_{k=1}^{j} (z - q^{4k-2}) \prod_{i=j+1}^{N_n} (1 - q^{4i-2}z) P_{(j_0 \bar{\lambda}_n + \bar{\lambda}_{n-2})}. \]

**4.4. \((D_{n+1}^{(1)}, V_1)\).** We use the same notations as in 4.3. Let us set \( i_0 = 0 \).

**4.4.1. Decomposition of the tensor product.** Let \( V(\Lambda_1) \) be the irreducible highest-weight \( U_q(\mathfrak{so}(2n))\)-module with highest weight \( \Lambda_1 \) and \( (L(\Lambda_1), B(\Lambda_1)) \) its crystal base. By [KN] the elements of \( B(\Lambda_1) \) are labeled in the following way.

\[ B(\Lambda_1) = \{ (i) | i \in \{ 1, 2, \ldots, n, \bar{n}, \ldots, \bar{1} \} \}. \]

Then

\[ (4.4.1) \quad V(\Lambda_1) \otimes V(\Lambda_1) \simeq V(2\Lambda_1) \oplus V(\Lambda_2) \oplus V(0). \]

**4.4.2. Construction of the representation of \( U_q^+((\mathfrak{so}(2n))\).** Define the actions of \( e_0 \) and \( f_0 \) on \( V(\Lambda_1) \) by

\[ f_0(\bar{1}) = (2), \quad f_0(\bar{2}) = (1), \quad f_0 b = 0 \text{ otherwise}, \]

\[ e_0(2) = (\bar{1}), \quad e_0(1) = (\bar{2}), \quad e_0 b = 0 \text{ otherwise}. \]

It is easily verified that \( V(\Lambda_1) \) is a well-defined \( U_q^+((\mathfrak{so}(2n))\)-module with the actions of \( e_0, f_0 \) given above and \( q^{b_0} = q^{-h_1 - 2(h_2 + \cdots + h_{n-2}) - h_{n-1} - h_n} \). We denote this \( U_q^+((\mathfrak{so}(2n))\)-module by \( V^1 \).

**4.4.3. Construction of a polarization of \( V^1 \).** Let \( (\ , \ ) \) be the polarization of the \( U_q(\mathfrak{so}(2n))\)-module \( V(\Lambda_1) \). Note that for any \( b \in B(\Lambda_1) \) and \( i \) (\( 1 \leq i \leq n \)), \( \varphi_i(b) + e_i(b) \leq 1 \). Hence, as in 4.1.3, \( (\ , \ ) \) is a polarization of \( U_q^+((\mathfrak{so}(2n))\)-module \( V^1 \).

**4.4.4. Calculation of the R-matrix.** By the decomposition (4.4.1), \( R(x/y) \) can be written as \( R(x/y) = \gamma_{2\Lambda_1} P_{2\Lambda_1} + \gamma_{\Lambda_2} P_{\Lambda_2} + \gamma_0 P_0 \), where \( P_{2\Lambda_1} \), etc. is, as in the previous sections, the projection to the corresponding \( U_q(\mathfrak{so}(2n))\)-irreducible component. Let \( u_0, u_{\Lambda_2} \) and \( u_{2\Lambda_1} \) be the highest-weight vectors in the \( U_q(\mathfrak{so}(2n))\)-module \( V(\Lambda_1) \otimes V(\Lambda_1) \) with the corresponding highest weights. Direct calculations show the following lemmas.
Lemma 4.4.1. The highest-weight vectors $u_0, u_{\Lambda_1},$ and $u_{2\Lambda_1}$ are, up to constants,
(1) $u_0 = \sum_{i=1}^{n} (-1)^{i-1} q^{i-1} (i) \otimes (i) + \sum_{i=0}^{n-1} (-1)^{n+i-1} q^{n+i} (n-i) \otimes (n-i),$ 
(2) $u_{\Lambda_1} = (1) \otimes (2) - q(2) \otimes (1),$ 
(3) $u_{2\Lambda_1} = (1) \otimes (1).$

Lemma 4.4.2. With the expressions of $u_0, u_{\Lambda_1},$ and $u_{2\Lambda_1}$ in Lemma 4.4.1, we have
in $V_1 \otimes V_1$
(1) $f_0u_0 = q^{-1}x^{-1}y^{-1}(x - q^{2n-2}y)u_{\Lambda_2},$
(2) $f_0f_2f_3 \cdots f_{n-2}f_nf_{n-1} \cdots f_2u_{\Lambda_2} = q^{-1}x^{-1}y^{-1}(x - q^2y)u_{2\Lambda_1}.$

By Lemma 4.4.2
\[
\frac{\gamma_0}{\gamma_{\Lambda_2}} = \frac{x - q^{2n-2}y}{y - q^{2n-2}x} \quad \text{and} \quad \frac{\gamma_{\Lambda_2}}{\gamma_{2\Lambda_1}} = \frac{x - q^2y}{y - q^2x}.
\]
So we have proved the following result.

Proposition 4.4.3. Let $z = xy^{-1}.$ The $R$-matrix, up to a multiple of an element of $Q(q)(z),$ is of the form
\[
R(z) = (1 - q^{2}z)(1 - q^{2n-2}z)P_{2\Lambda_1} \oplus (z - q^{2})(1 - q^{2n-2}z)P_{\Lambda_2}
\]
\[
\oplus (z - q^{2n-2})(z - q^2)P_0.
\]

4.5. ($B_n^{(1)}, V^1$). Let $g = \widehat{\text{so}(2n + 1)}$ be the affine Lie algebra of type $B_n^{(1)}.$ We assume that $(\langle h_i, \varepsilon_j \rangle)_{1 \leq i, j \leq n}$ is the Cartan matrix of type $B_n.$ We set $i_0 = 0.$ Let $U_q(\widehat{\text{so}(2n + 1)})$ be the subalgebra of $U_q(\widehat{\text{so}(2n + 1)})$ associated with $\{h_i, \varepsilon_j | 1 \leq i, j \leq n\}.$ In this case $q_n = q$ and $q_i = q^i (i \neq n).$

4.5.1. Decomposition of the tensor product. Let $V(\Lambda_1)$ be the irreducible highest-weight $U_q(\widehat{\text{so}(2n + 1)})$-module with highest weight $\Lambda_1$ and $(L(\Lambda_1), B(\Lambda_1))$ its crystal base. By [KN] the elements of $B(\Lambda_1)$ are labeled in the following way.

\[
B(\Lambda_1) = \{(i) | i \in \{1, 2, \ldots, n, 0, \bar{n}, \ldots, \bar{1}\}\}.
\]

Then

(4.5.1) $V(\Lambda_1) \otimes V(\Lambda_1) \simeq V(2\Lambda_1) \oplus V(\Lambda_2) \oplus V(0).$

The highest-weight elements for the corresponding crystals are given by

(1) $\otimes (1)$ for $B(2\Lambda_1),$ \quad (1) $\otimes (2)$ for $B(\Lambda_2),$ \quad and (1) $\otimes (\bar{1})$ for $B(0).$
4.5.2. Construction of the representation of \( U_q(\widehat{\mathfrak{so}}(2n + 1)) \). Define the actions of \( e_0 \) and \( f_0 \) on \( V(\Lambda_1) \) by
\[
 f_0(\bar{2}) = (1), \quad f_0(\bar{1}) = (2), \quad f_0 b = 0 \text{ otherwise},
 e_0(1) = (\bar{2}), \quad e_0(2) = (\bar{1}), \quad e_0 b = 0 \text{ otherwise}.
\]
It is easily verified that \( V(\Lambda_1) \) is a well-defined \( U_q(\widehat{\mathfrak{so}}(2n + 1)) \)-module with the actions of \( e_0, f_0 \) given above and \( q^{b_0} = q^{-h_1 - 2(h_2 + \cdots + h_n) - h_n} \). We denote this \( U_q(\widehat{\mathfrak{so}}(2n + 1)) \)-module by \( V^1 \).

4.5.3. Construction of a polarization of \( V^1 \). Let \((\ , \ )\) be the polarization of the \( U_q(\mathfrak{so}(2n + 1)) \)-module \( V(\Lambda_1) \). By using Lemma 4.1.2 we have
\[
((i), (i)) = q_n[2]_n((0), (0)) \quad \text{for } i \in \{1, \ldots, n, \bar{n}, \ldots, \bar{1}\}.
\]
It follows from this that \((\ , \ )\) is a polarization of \( U_q(\widehat{\mathfrak{so}}(2n + 1)) \)-module \( V^1 \).

4.5.4. Calculation of the R-matrix. By the decomposition (4.5.1), \( R(x/y) \) can be written as \( R(x/y) = \gamma_{2\Lambda_2} P_{2\Lambda_2} \oplus \gamma_{\Lambda_2} P_{\Lambda_2} \oplus \gamma_0 P_0 \), where \( P_{2\Lambda_2} \), etc., are, as in the previous sections, the projections to the corresponding \( U_q(\mathfrak{so}(2n + 1)) \)-irreducible components. Let \( u_0, u_{\Lambda_2}, \) and \( u_{2\Lambda_1} \) be the highest-weight vectors in the \( U_q(\mathfrak{so}(2n + 1)) \)-module \( V(\Lambda_1) \otimes V(\Lambda_1) \) with the corresponding highest weights. Direct calculations show the following lemmas.

**Lemma 4.5.1.** The highest-weight vectors \( u_0, u_{\Lambda_2}, \) and \( u_{2\Lambda_1} \), are, up to constants,
1. \( u_0 = \sum_{i=1}^n (-1)^{i-1} q^{2(i-1)}(i) \otimes (i) + (-1)^n [2]_n q^{2(n-1)}(0) \otimes (0) \)
2. \( u_{\Lambda_2} = (1) \otimes (2) - q^2(2) \otimes (1) \)
3. \( u_{2\Lambda_1} = (1) \otimes (1) \).

**Lemma 4.5.2.** Consider the highest-weight vectors \( u_0, u_{\Lambda_2}, \) and \( u_{2\Lambda_1} \) in Lemma 4.5.1. Then we have in \( V^1 \otimes V^1 \)
1. \( f_0 u_0 = q^{-x^{-1}y^{-1}}(x - q^{4n-2}y)u_{\Lambda_2} \)
2. \( f_0 f_2 f_3 \cdots f_{n-1} f_{n-1} f_{n-1} f_2 f_2 f_2 u_{\Lambda_2} = q^{-2x^{-1}y^{-1}}(x - q^4y)u_{2\Lambda_1} \)

By Lemma 4.5.2
\[
\frac{\gamma_{\Lambda_2}}{\gamma_0} = \frac{y - q^{4n-2}x}{x - q^{4n-2}y} \quad \text{and} \quad \frac{\gamma_{2\Lambda_1}}{\gamma_{\Lambda_2}} = \frac{y - q^4x}{x - q^4y}.
\]
So we have proved the following proposition.

**Proposition 4.5.3.** Let \( z = xy^{-1} \). The R-matrix, up to a multiple of an element of \( \mathcal{Q}(q)(z) \), is of the form
\[
R(z) = (1 - q^4z)(1 - q^{4n-2}z)P_{2\Lambda_1} \oplus (1 - q^{4n-2}z)(z - q^4)P_{\Lambda_2} \oplus (z - q^4)(z - q^{4n-2})P_0.
\]
4.6. \((A_{2n-1}^{(2)}, V^1)\). Let \(q\) be the affine Lie algebra of type \(A_{2n-1}^{(2)}\). We assume that 
\([h, \alpha_j]\), \(1 \leq i, j \leq n\) is the Cartan matrix of type \(C_n\). We set \(i_0 = 0\). Let \(U_q(\mathfrak{sp}(n))\) be the subalgebra of \(U_q(\mathfrak{g})\) associated with \([h, \alpha_i] \mid 1 \leq i, j \leq n\). In this case \(q_n = q^2\) and 
\(q_i = q(i \neq n)\).

4.6.1. Decomposition of the tensor product. Let \(V(\Lambda_1)\) be the irreducible highest-weight \(U_q(\mathfrak{sp}(n))\)-module with highest weight \(\Lambda_1\) and \((L(\Lambda_1), B(\Lambda_1))\) its crystal base. By [KN] the elements of \(B(\Lambda_1)\) are labeled in the following way.

\[B(\Lambda_1) = \{(i) \mid i \in \{1, 2, \ldots, n, \bar{n}, \ldots, \bar{1}\}\}.\]

Then

\[(4.6.1) \quad V(\Lambda_1) \otimes V(\Lambda_1) \simeq V(2\Lambda_1) \oplus V(\Lambda_2) \oplus V(0).\]

The highest-weight elements for the corresponding crystals are given by

\[(1) \otimes (1) \text{ for } B(2\Lambda_1), \quad (1) \otimes (2) \text{ for } B(\Lambda_2) \quad \text{and } (1) \otimes (\bar{1}) \text{ for } B(0).\]

4.6.2. Construction of the representation of \(U_q^r(\mathfrak{g})\). Define the actions of \(e_0\) and \(f_0\) on \(V(\Lambda_1)\) by

\[f_0(\bar{2}) = (1), \quad f_0(\bar{1}) = (2), \quad f_0 b = 0 \text{ otherwise,}\]

\[e_0(1) = (\bar{2}), \quad e_0(2) = (\bar{1}), \quad e_0 b = 0 \text{ otherwise.}\]

It is easily verified that \(V(\Lambda_1)\) is a well-defined \(U_q^r(\mathfrak{g})\)-module with the actions of \(e_0, f_0\) given above and \(q_{i_0} = q^{h_1-2h_2-\cdots-h_n}\). We denote this \(U_q^r(\mathfrak{g})\)-module by \(V^1\).

4.6.3. Construction of a polarization of \(V^1\). Let \((,\,\,\,)\) be the polarization of the \(U_q(\mathfrak{g}_{n_0})\)-module \(V(\Lambda_1)\). Note that for any \(b \in B(\Lambda_1)\) and \(i(1 \leq i \leq n)\), \(q_{i_0}(b) + \epsilon_i(b) \leq 1\). Hence, as in 4.1.3, \((,\,\,\,)\) is a polarization of \(U_q^r(\mathfrak{g})\)-module \(V^1\).

4.6.4. Calculation of the \(R\)-matrix. By the decomposition (4.6.1), \(R(x, y)\) can be written as \(R(x, y) = \gamma_{2\Lambda_1} P_{2\Lambda_1} \oplus \gamma_{\Lambda_2} P_{\Lambda_2} \oplus \gamma_0 P_0\), where \(P_{2\Lambda_1}\), etc. are, as in the previous sections, the projections to the corresponding \(U_q(\mathfrak{g}_{n_0})\)-irreducible components. Let \(u_0, u_{\Lambda_2}\) and \(u_{2\Lambda_1}\) be the highest-weight vectors in the \(U_q(\mathfrak{g}_{n_0})\)-module \(V(\Lambda_1) \otimes V(\Lambda_1)\) with the corresponding highest weights. Direct calculations show the following lemmas.

**Lemma 4.6.1.** The highest-weight vectors \(u_0, u_{\Lambda_2}, \text{ and } u_{2\Lambda_1}\) are, up to constants,

1. \(u_0 = \sum_{i=1}^{n} (-1)^{i-1} q^{i-1} (i) \otimes (i) + \sum_{i=0}^{n-1} (-1)^{n+i} q^i q^{n+i+1} (n-i) \otimes (n-i),\)
2. \(u_{\Lambda_2} = (1) \otimes (2) - q(2) \otimes (1),\)
3. \(u_{2\Lambda_1} = (1) \otimes (1).\)

**Lemma 4.6.2.** With the expressions of \(u_0, u_{\Lambda_2}\) and \(u_{2\Lambda_1}\) in Lemma 4.6.1, we have in \(V_x^1 \otimes V_y^1\)
(1) \( f_0 u_0 = q^{-1}x^{-1}y^{-1}(x + q^2y)u_{\Lambda_2} \),
(2) \( f_0 f_2 f_5 \cdots f_{n-1} f_n f_{n-1} \cdots f_2 u_{\Lambda_2} = q^{-1}x^{-1}y^{-1}(x - q^2y)u_{2\Lambda_1} \).

By Lemma 4.6.2

\[
\gamma_{\Lambda_2} = \frac{y + q^{2n}x}{x + q^{2n}y} \quad \text{and} \quad \gamma_{2\Lambda_1} = \frac{y - q^{2n}x}{x - q^{2n}y}.
\]

So we have proved the following proposition.

**Proposition 4.6.3.** Let \( z = xy^{-1} \). The R-matrix, up to a multiple of an element of \( \mathbb{Q}(q)(z) \), is of the form

\[
R(z) = (1 - q^2z)(1 + q^{2n}z)P_{2\Lambda_1} \oplus (1 + q^{2n}z)(z - q^2)P_{\Lambda_2} \oplus (z - q^2(z + q^{2n})P_0.
\]

4.7. \( A_n^{(2)}, V^1 \). Let \( g \) be the affine Lie algebra of type \( A_n^{(2)} \). We assume that \( \langle h_i, g_j \rangle_{1 \leq i, j \leq n} \) and \( \langle h_i, g_j \rangle_{0 \leq i, j \leq n-1} \) are the Cartan matrices of type \( C_n \) and \( B_n \) respectively. We set \( i_0 = n \). Let \( U_q(\mathfrak{sp}(n)) \) and \( U_q(\mathfrak{so}(2n + 1)) \) be the subalgebras of \( U_q(\mathfrak{g}) \) associated with \( \{ h_i, g_j \mid 1 \leq i \leq j \leq n \} \) and \( \{ h_i, g_j \mid 0 \leq i \leq j \leq n-1 \} \) respectively. We define a bijective map \( \iota : \{ 0, 1, \ldots, n - 1 \} \rightarrow \{ 1, \ldots, n \} \) by \( \iota(p) = n - p \). In this case \( q_0 = q, q_i = q^2(i \neq 0, n) \) and \( q_n = q^4 \).

4.7.1. Construction of the representation of \( U_q(\mathfrak{g}) \). Let \( V(\Lambda_1) \) be the irreducible highest-weight \( U_q(\mathfrak{so}(2n + 1)) \)-module with highest weight \( \Lambda_1 \) and \( (L(\Lambda_1), B(\Lambda_1)) \) its crystal base. The parametrization of elements of \( B(\Lambda_1) \) is already given in 4.5. Define the actions of \( e_n \) and \( f_n \) on \( \iota^* V(\Lambda_1) \) by

\[
f_n(\bar{1}) = (1), \quad f_n b = 0 \quad \text{otherwise},
\]

\[
e_n(1) = (\bar{1}), \quad e_n b = 0 \quad \text{otherwise}.
\]

It is easily verified that \( \iota^* V(\Lambda_1) \) is a well-defined \( U_q(\mathfrak{g}) \)-module by the actions of \( e_n, f_n \) given above and \( q^{h_0} = q^{-h_0 + \cdots + h_{n-1}} \). We denote this \( U_q(\mathfrak{g}) \)-module by \( V^1 \).

4.7.2. Construction of a polarization of \( V^1 \). Let \( (\ , \ ) \) be the polarization of the \( U_q(\mathfrak{so}(2n + 1)) \)-module \( V(\Lambda, \Lambda_1) \). As in 4.5.3, \( (\ , \ ) \) is a polarization of \( U_q(\mathfrak{g}) \)-module \( V^1 \).

4.7.3. Calculation of the R-matrix. By the decomposition (4.5.1), \( R(x/y) \) can be written as \( R(x/y) = \gamma_{2\Lambda_{n-1}} \iota^* P_{2\Lambda_1} \oplus \gamma_{\Lambda_{n-2}} \iota^* P_{\Lambda_2} \oplus \gamma_0 \iota^* P_0 \), where \( P_{2\Lambda_1}, \) etc. are, as in the previous sections, the projections to the corresponding \( U_q(\mathfrak{so}(2n + 1)) \)-irreducible components. Let \( u_0, u_{\Lambda_{n-2}}, \) and \( u_{2\Lambda_{n-1}} \) be the highest-weight vectors in the \( U_q(\mathfrak{so}(2n + 1)) \)-module \( \iota^* V(\Lambda_1) \otimes \iota^* V(\Lambda_1) \) with the corresponding highest weights. Direct calculations show the following lemma.

**Lemma 4.7.2.** With the expressions of \( u_0, u_{\Lambda_{n-2}}, \) and \( u_{2\Lambda_{n-1}} \) in Lemma 4.5.1, we have in \( V^1_x \otimes V^1_y \)
(1) \( f_n u_0 = q^{-4} x y^{-1} (x + q^{4n+2} y) u_{2 \Lambda_{n-1}} \),

(2) \( f_{n} f_{n-1} \cdots f_{1} f_{0}^{(2)} f_{1} f_{2} \cdots f_{n-2} u_{\Lambda_{n-2}} = q^{-2} x y^{-1} (x - q^4 y) u_{2 \Lambda_{n-1}} \).

By Lemma 4.7.2

\[
\frac{\gamma_{2 \Lambda_{n-1}}}{\gamma_0} = \frac{y + q^{4n+2} x}{x + q^{4n+2} y} \quad \text{and} \quad \frac{\gamma_{2 \Lambda_{n-1}}}{\gamma_{\Lambda_{n-2}}} = \frac{y - q^4 x}{x - q^4 y}.
\]

So we have proved the following proposition.

**Proposition 4.7.3.** Let \( z = xy^{-1} \). The R-matrix, up to a multiple of an element of \( \mathbb{Q}(q)(z) \), is of the form

\[
R(z) = (1 - q^4 z)(1 + q^{4n+2} z)P_{2 \Lambda_1} \oplus (1 + q^{4n+2} z)(z - q^4) P_{\Lambda_2} \oplus (1 - q^4 z)(z + q^{4n+2}) P_0.
\]

4.8. \((D^{(2)}_{n+1}, V^1)\). Let \( g \) be the affine Lie algebra of type \( D^{(2)}_{n+1} \). We assume that \( (\langle h_i, \alpha_j \rangle)_{1 \leq i, j \leq n} \) is the Cartan matrix of type \( B_n \). Let \( U_q(\mathfrak{so}(2n + 1)) \) be the subalgebra of \( U_q(g) \) associated with \( \{ h_i, \alpha_j \mid 1 \leq i, j \leq n \} \). We set \( l_0 = 0 \). In this case \( q_0 = q_n = q \).

4.8.1. **Construction of the representation of \( U_q'(g) \).** Let \( V(\Lambda_1) \oplus V(0) \) be the direct sum of the irreducible highest-weight \( U_q(\mathfrak{so}(2n + 1)) \)-modules with highest weights \( \Lambda_1 \) and 0 respectively and \( (L(\Lambda_1) \oplus L(0), B(\Lambda_1) \oplus B(0)) \) its crystal base. Since the dimension of any nonzero weight space of \( V(\Lambda_1) \) is one, we denote, as usual, by \( b \) the lower global base corresponding to \( b \in B(\Lambda_1) \). Let us denote by \( (\cdot) \) the element of \( B(0) \). The parametrization of elements of \( B(\Lambda_1) \) is also given by \([KN]\) as

\[
B(\Lambda_1) = \{ (i) \mid i \in \{ 1, 2, \ldots, n, 0, \bar{n}, \ldots, \bar{1} \} \}.
\]

Define the actions of \( e_0 \) and \( f_0 \) on \( V(\Lambda_1) \oplus V(0) \) by

\[
e_0(\cdot) = [2]_0(1), \quad f_0(\cdot) = [2]_0(1), \quad f_0 b = 0 \text{ otherwise,}
\]

\[
e_0(\cdot) = [2]_0(\bar{1}), \quad e_0(1) = (\cdot), \quad e_0 b = 0 \text{ otherwise.}
\]

It is easily verified that \( V(\Lambda_1) \oplus V(0) \) is a well-defined \( U_q'(g) \)-module with the actions of \( e_0, f_0 \) given above and \( q_0 = q^{-2(h_1 + \cdots + h_n)} \). We denote this \( U_q'(g) \)-module by \( V^1 \).

4.8.2. **Construction of a polarization of \( V^1 \).** Let \( (\cdot, \cdot) \) be the polarization of the \( U_q(\mathfrak{so}(2n + 1)) \)-module \( V(\Lambda_1) \). We shall define a symmetric bilinear form \( (\cdot, \cdot) \) on \( V^1 \) by

\[
(\cdot, u) = (u, (\cdot)) = 0 \quad \text{for} \ u \in V(\Lambda_1),
\]

\[
(\cdot, \cdot) = q_0 [2]_0 (\cdot, (\cdot)),
\]

\[
(u, v) = (u, v)_{\Lambda_1} \quad \text{for} \ u, v \in V(\Lambda_1).
\]
Since $(\ ,\ )_i$ is positive definite, $(\ ,\ )$ is positive definite. As already proved in 4.5.3, $(\langle I, I\rangle) = ((1), (1))$. It follows that $(\ ,\ )$ is a polarization of the $U_q'(g)$-module $V^1$.

4.8.3. Decomposition of the tensor product. As a $U_q(\mathfrak{so}(2n + 1))$-module, we have the splitting

\[(V(\Lambda_1) \otimes V(0)) \otimes (V(\Lambda_1) \otimes V(0)) \cong V(2\Lambda_1) \otimes V(\Lambda_2) \otimes V(\Lambda_1)^{\otimes 2} \otimes V(0)^{\otimes 2}.
\]

**Lemma 4.8.1.** $\ u_{2\Lambda_1}, u_{\Lambda_2}, u_{\Lambda_1}^1, u_{\Lambda_1}^2, u_0^1,$ and $u_0^2$ are the highest-weight vectors with the weights $2\Lambda_1, \Lambda_2, \Lambda_1, \Lambda_1, 0,$ and $0$ respectively.

1. $u_{2\Lambda_1} = (1) \otimes (1)$.
2. $u_{\Lambda_2} = (1) \otimes (2) - q^2(2) \otimes (1)$.
3. $u_{\Lambda_1}^1 = (1) \otimes (\cdot)$.
4. $u_{\Lambda_1}^2 = (\cdot) \otimes (1)$.
5. $u_0^1 = (\cdot) \otimes (\cdot)$.
6. $u_0^2 = \sum_{i=1}^{n^2-1} (-1)^{-1-1} q^{2(i-1)}(\cdot) \otimes (\cdot) + (-1)^n q^{2(n-1)}[2]_{n}^{-1} (0) \otimes (0) + \sum_{i=1}^{n^2-1} (-1)^{n+i+1} q^{2(n-i)}(n-i) \otimes (n-i)$.

4.8.4. Calculation of the $R$-matrix. We express the $R$-matrix $R = R(x/y)$ as

\[
R(u_{2\Lambda_1}) = a^{2\Lambda_1}u_{2\Lambda_1}, \quad R(u_{\Lambda_2}) = a^{\Lambda_2}u_{\Lambda_2},
\]

\[
R(u_{\Lambda_1}^1) = \sum_{j=1}^{n^2} a_{ij}^1 u_{\Lambda_1}^1, \quad R(u_0^1) = \sum_{j=1}^{n^2} a_{ij}^0 u_0^1.
\]

**Lemma 4.8.2.** Consider the highest-weight vectors defined in Lemma 4.8.1. Then we have in $V_{\Lambda_1} \otimes V_{\Lambda_2}^1$

1. $e_0 u_{2\Lambda_1} = y u_{\Lambda_1}^1 + q^2 x u_{\Lambda_1}^2$.
2. $f_0 f_1 \cdots f_{n-1} f_n(2)f_{n-1} f_{n-2} \cdots f_1 u_{2\Lambda_1} = x^{-1} y^{-1} (q^2 x u_{\Lambda_1}^1 + y u_{\Lambda_1}^2)$.
3. $f_0 f_1 \cdots f_{n-1} f_n(2)f_{n-1} f_{n-2} \cdots f_1 u_{\Lambda_2} = x^{-1} y^{-1} (x u_{\Lambda_1}^1 - q^2 y u_{\Lambda_1}^2)$.
4. $f_0 u_0^1 = [2]_q x^{-1} y^{-1} (y u_{\Lambda_1}^1 + x u_{\Lambda_1}^2)$.
5. $f_0 u_0^2 = q^{-2} x^{-1} y^{-1} (x u_{\Lambda_1}^1 + q^4 y u_{\Lambda_1}^2)$.

From this we obtain

\[
\begin{pmatrix} y & q^2 x \\ q^2 x & y \end{pmatrix}(a_{ij}^{\Lambda_1}) = a^{2\Lambda_1}(x & q^2 y \\ q^2 y & c),
\]

\[
(x, -q^2 y)(a_{ij}^{\Lambda_2}) = a^{\Lambda_2}(y, -q^2 x),
\]

\[
\begin{pmatrix} q(1 + q^2)y & q(1 + q^2)x \\ q(1 + q^2)x & q^4 y \end{pmatrix}(a_{ij}^{\Lambda_1}) = (a_{ij}^0)\begin{pmatrix} q(1 + q^2)x & q(1 + q^2)y \\ y & q^4 x \end{pmatrix}.
\]

Let $P_{2\Lambda_1}, P_{\Lambda_2}, P_{\Lambda_1}^i (i = 1, 2)$ and $P_{\Lambda_1}^0(i = 1, 2)$ be the projections from $V^1 \otimes V^1$ to $V(2\Lambda_1), V(\Lambda_2), U_q(\mathfrak{so}(2n + 1))u_{\Lambda_1}^i (i = 1, 2)$ and $U_q(\mathfrak{so}(2n + 1))u_0^i (i = 1, 2)$ respec-
tively, where \( u_{2A} \), etc. are the highest-weight vectors in Lemma 4.8.1. Then we have the following result.

**Proposition 4.8.3.** Let \( z = xy^{-1} \). The \( R \)-matrix, up to a multiple of an element of \( Q(q)(z) \), is of the form

\[
R(z) = (1 - q^4 z^2)(1 - q^{4n} z^2)P_{2\Lambda_1} \oplus (1 - q^{4n} z^2)(z^2 - q^4)P_{\Lambda_2}
\]

\[
\oplus \bigoplus_{i=1}^2 \sum_{j=1}^2 a_{ij}^{\Lambda_1} P_{\Lambda_1} \oplus \bigoplus_{j=1}^2 \sum_{k=1}^2 a_{jk}^0 P_{\delta^0}.
\]

Here \( (a_{ij}^{\Lambda_1}) \) and \( (a_{ik}^0) \) are given by

\[
(a_{ij}^{\Lambda_1}) = (1 - q^{4n} z^2) \begin{pmatrix} \frac{1}{q^2 - 1} & q^2(1 - z^2) \\ \frac{1}{q^2 - 1} & 1-q^4 \end{pmatrix},
\]

\[
a_{11}^0 = q^2 + (1 - q^2 - q^4 - q^{4n} - q^{4n+2} + q^{4n+4})z^2 + q^{4n+2}z^4,
\]

\[
a_{22}^0 = q^{4n+2} + (1 - q^2 - q^4 - q^{4n} - q^{4n+2} + q^{4n+4})z^2 + q^2z^4,
\]

\[
a_{12}^0 = q(1 + q^2)(1 - q^4)z(1 - z^2)
\]

\[
a_{21}^0 = (1 + q^2)^{-1}q(1 + q^{4n-2})(1 - q^{4n-2})z(1 - z^2).
\]

The eigenvalues of \( (a_{ij}^{\Lambda_1}) \) are \( (1 - q^{4n} z^2)(z + q^2)(1 - q^2 z)(1 - q^4) \times (1 + q^2 z) \). Furthermore,

\[
\det(a_{ij}^0) = (z^2 - q^{4n})(1 - q^{4n} z^2)(z^2 - q^4)(1 - q^4 z^2).
\]

In particular, the eigenvalues of \( (a_{ij}^0) \) have no common zeros.

4.9. \((D_{n+1}^{(2)}, V^n)\). We use the same notations as in 4.8. We set \( i_0 = 0 \).

4.9.1. Decomposition of the tensor product. Let \( V(\Lambda_n) \) be the irreducible highest-weight \( U_q(\mathfrak{so}(2n + 1)) \)-module with highest weight \( \Lambda_n \) and \( (L(\Lambda_n), B(\Lambda_n)) \) its crystal base. Define \( \bar{\Lambda}_i \) \((i \in \mathbb{Z})\) by

\[
\bar{\Lambda}_i = \begin{cases} \Lambda_i & \text{for } 1 \leq i \leq n, \\ 0 & \text{otherwise.} \end{cases}
\]

By [KN] the elements of \( B(\Lambda_n) \) are labeled in the following way.

\[
B(\Lambda_n) = \{(m_i)_{i=1}^n \mid m_i = + \text{ or } - \}.
\]
Then

\[(4.9.1) \quad V(\Lambda_n) \otimes V(\Lambda_n) \simeq \bigoplus_{i=0}^n V(\delta_i \tilde{\Lambda}_n + \tilde{\Lambda}_{n-i}).\]

The highest-weight elements for the corresponding crystals are given by

\[(+, \cdots, +) \otimes (+, \cdots, \frac{i}{2}, -, \cdots, -) \quad \text{for } B(\delta_i \tilde{\Lambda}_n + \tilde{\Lambda}_{n-i}).\]

4.9.2. Construction of the representation of \(U_q(g)\). Define the actions of \(e_0\) and \(f_0\) on \(V(\Lambda_n)\) by

\begin{align*}
    f_0 b &= \begin{cases} (+, i_1, \ldots, i_{n-1}) & \text{if } b = (-, i_1, \ldots, i_{n-1}) \\ 0 & \text{otherwise} \end{cases} \\
    e_0 b &= \begin{cases} (-, j_1, \ldots, j_{n-1}) & \text{if } b = (+, j_1, \ldots, j_{n-1}) \\ 0 & \text{otherwise} \end{cases}
\end{align*}

It is easily verified that \(V(\Lambda_n)\) is a well-defined \(U_q(g)\)-module with the actions of \(e_0, f_0\) given above and \(q^{h_0} = q^{-2h_1 + \cdots + h_{n-1} - h_n}\). We denote this \(U_q(g)\)-module by \(V^n\).

4.9.3. Construction of a polarization of \(V^n\). Let \((, , )\) be the polarization of the \(U_q(\mathfrak{so}(2n+1))\)-module \(V(\Lambda_n)\). As in 4.3.3, \((, , )\) is a polarization of the \(U_q(g)\)-module \(V^n\).

4.9.4. Calculation of the R-matrix. By the decomposition \(4.9.1\), \(R(x/y)\) can be written as \(R(x/y) = \bigoplus_{i=1}^n \gamma_i P_{\delta_i \tilde{\Lambda}_n + \tilde{\Lambda}_i}\), where \(P_{\delta_i \tilde{\Lambda}_n + \tilde{\Lambda}_i}\) is the projection \(P_{\delta_i \tilde{\Lambda}_n + \tilde{\Lambda}_i}\) \(V(\Lambda_n) \otimes V(\Lambda_n) \rightarrow V(\delta_i \tilde{\Lambda}_n + \tilde{\Lambda}_i)\). Let \(u_i(0 \leq i \leq n)\) be the highest-weight vector in the \(U_q(\mathfrak{so}(2n+1))\)-module \(V(\Lambda_n) \otimes V(\Lambda_n)\) with the weight \(\delta_i \tilde{\Lambda}_n + \tilde{\Lambda}_i\). We set \(P_i = f_0 f_1 f_2 \cdots f_i\). Let us define \(b_1^{(i)}\) and \(b_2^{(i)}\) by

\begin{align*}
    b_1^{(i)} &= (+, \cdots, +) \otimes (+, \cdots, \frac{i}{2}, -, \cdots, -), \\
    b_2^{(i)} &= (+, \cdots, +, \frac{i+1}{2}, +, \cdots, +) \otimes (+, \cdots, +, \frac{i+1}{2}, -, \cdots, -).
\end{align*}

The proofs of the following two lemmas are similar to those of Lemma 4.1.3 and 4.1.4.

**Lemma 4.9.2.** The element \(P_i u_i (0 \leq i \leq n - 1)\) is proportional to \(u_{i+1}\).

**Lemma 4.9.3.** Let \(b\) be an element of \(V^n \otimes V^n\) which is a tensor product of global bases and has the weight \(\delta_i \tilde{\Lambda}_n + \tilde{\Lambda}_i\). Set \(P_i b = \sum b' F_b^{b'}\). Then \(F_b^{b_1^{(i+1)}} \neq 0\) if and only if \(b = b_1^{(i)}\) or \(b_2^{(i)}\). Moreover, \(P_i b_1^{(i)} = q^{-1} y^{-1} b_1^{(i+1)}\) and \(P_i b_2^{(i)} = x^{-1} b_1^{(i+1)}\).

**Lemma 4.9.4.** If we write \(u_i = b_1^{(i)} + \sum a_k b\), then \(a_{\frac{i+1}{2}} = (-1)^{n-i} q^{2(n-i)+3}\).
Proof. Let \( b_k = (+, \cdots, +, \frac{k}{i}, +, \cdots, +, \frac{k}{i}, \cdots, -, \frac{k}{i}, -, \cdots, -) \) for \( i + 1 \leq k \leq n \) and \( b_{n+1}^{(i)} = (+, \cdots, +, \frac{k}{i}, \cdots, -, \frac{k}{i}, -, \cdots, -) \). By using

\[
e_{k-1}(b_k - q^{-2}b_{k-1}) = 0 \quad \text{for} \quad i + 2 \leq k \leq n,
\]

\[
e_n(b_{n+1} - qb_n) = 0,
\]

\[
e_n(b_{n+1}^{(i)} - qb_{n+1}) = 0,
\]

it is easily verified that \( u_i \) must be of the form

\[
u_i = b_i^{(i)} + \sum_{j=0}^{i-1} (-1)^{i+j} q^{2j+1} b_{n-j}
\]

+ (terms without the elements of the global base already appeared). \( \square \)

By these lemmas we have in \( V_x^1 \otimes V_y^1 \)

\[
P_i u_i = q^{-1} x^{-1} y^{-1} (x + (-1)^{n-i} q^{2(n-i+2)} y) u_i + 1,
\]

where \( u_i (0 \leq i \leq n) \) are normalized as in Lemma 4.9.4. From this

\[
y_{i+1} \gamma_i = \frac{y + (-1)^{n-i} q^{2(n-i+2)} x}{x + (-1)^{n-i} q^{2(n-i+2)} y}
\]

for \( 0 \leq i \leq n - 1 \).

So we have proved the following result.

PROPOSITION 4.9.5. Let \( z = xy^{-1} \). The R-matrix, up to a multiple of an element of \( \mathbb{Q}(q)(z) \), is of the form

\[
R(z) = \sum_{r=0}^{n-1} \prod_{i=0}^{r-1} (1 + (-1)^{n-i} q^{2(n-i+2)} z) \prod_{j=r}^{n-1} (z + (-1)^{n-j} q^{2(n-j+2)} z) P_{\lambda, \lambda, \lambda}.
\]

5. Applications of fusion construction.

5.1. (\( A_n^{(1)} \), \( V(l(\Lambda_k - \Lambda_0)) \)). Let us take \( A_n^{(1)} \) as \( q \) and let \( I \) and \( i_0 \) be as in 4.1. Let \( V = V^k \) (\( 1 \leq k \leq n \)) be the \( U_q(g) \)-module with the polarization constructed in 4.1.1. Then as an \( U_q(g) \)-module, \( V = V^k \) is isomorphic to \( V(\Lambda_k - \Lambda_0) \). Now, we shall employ the results and notations in Section 3. Taking \( \lambda_0 = \Lambda_k - \Lambda_0 \), the condition (3.1.1) is satisfied. The existence of \( V_{K_q} \) is obvious. We have, by using the explicit form of the R-matrix in Proposition 4.1.6,

\[
\varphi(z) = \prod_{j=1}^{\min(n+1-k, k)} (1 - q^{2j} z).
\]
Here $\varphi(u)$ is the one given in (3.1.6). Therefore if we set

(5.1.1) \hspace{1cm} r = 1,

the condition (3.3.4) is satisfied. We have

$$R(q^{2r}) = \varphi(q^{2r})P_{2\lambda_0}.$$  

Here $P_{2\lambda_0}$ is the projector to the $U_q(\mathfrak{g}_{I,\{i_0\}})$-module $V(2\lambda_0)$. Hence we obtain

(5.1.2) \hspace{1cm} \text{Im } R(q^{2r}) = V(2\lambda_0).

Therefore, we obtain by (3.3.9)

(5.1.3) \hspace{1cm} V_I \subset \bigcap_{j=0}^{l-2} V(\lambda_0)^{\otimes j} \otimes V(2\lambda_0) \otimes V(\lambda_0)^{\otimes l-2-j}.

Thus, applying [KN], we obtain the following lemma.

**Lemma 5.1.1.** Let $I_0 = I \setminus \{0\}$. Then as an $U_q(\mathfrak{g}_{I_0})$-module, $V_I$ is isomorphic to the irreducible highest-weight module with highest weight $l(\Lambda_k - \Lambda_0)$.

By applying Proposition 3.4.4, we obtain the following proposition.

**Proposition 5.1.2.** For $1 \leq l$ and $1 \leq k \leq n$, there exists a polarized $U_q'(\mathfrak{g})$-module $V^k_I$ satisfying the following:

(i) $V^k_I$ has a crystal pseudobase.

(ii) For any $j \in I$, $V^k_I$ is isomorphic as a $U_q(\mathfrak{g}_{I \setminus \{j\}})$-module to the irreducible module with highest weight $l(\Lambda_{j+k} - \Lambda_j)$.

**Proof.** (i) is an immediate consequence of Proposition 3.4.4, and (ii) is already proved for $j = 0$. Since the Weyl group contains the cyclic permutation, $I \ni i \mapsto i + j \in I$, wt($V^k_I$) $\supset l(\Lambda_{j+k} - \Lambda_j)$ and wt($V^k_I$) $\subset l(\Lambda_{j+k} - \Lambda_j) + \sum_{i \neq j} Z_{<0} c(l(x_i))$. Hence $V^k_I$ contains the $U_q(\mathfrak{g}_{I \setminus \{j\}})$-module $V(l(\Lambda_{j+k} - \Lambda_j))$. Comparing the dimensions, we obtain $V^k_I = V(l(\Lambda_{j+k} - \Lambda_j))$. \hfill $\square$

5.2. $(C_n^{(1)}, V(l(\Lambda_\infty - \Lambda_0)))$. Let $q$ be of type $C_n^{(1)}$ and $I$, $i_0$ as in 4.2. In 4.2 we constructed $U_q'(\mathfrak{g})$-module $V$ with polarization. It is obvious that $V$ has $V_{\mathfrak{g}^\infty}$. As a $U_q(\mathfrak{g}_{I,\{i_0\}})$-module, $V$ is isomorphic to $V(\Lambda_\infty - \Lambda_0)$. Hence taking $\lambda_0 = \Lambda_\infty - \Lambda_0$, the condition (3.1.1) is satisfied. By the explicit form of the $R$-matrix given in Proposition 4.2.6,

$$\varphi(z) = \prod_{j=1}^{n} (1 - q^{2j+1}z).$$

Therefore, if we set

(5.2.1) \hspace{1cm} r = 2,
then the condition (3.3.4) is satisfied. We have

\[ R(q^{2r}) = \varphi(q^{2r})P_{2\lambda_0}. \]

Here \( P_{2\lambda_0} \) is the projection to the \( U_q(g_{l\setminus\{i_0\}}) \)-module \( V(2\lambda_0) \). Thus, by [KN] and Proposition 3.4.4, we have the following.

**Proposition 5.2.1.**

(i) \( V_i \) has a crystal pseudobase.

(ii) \( V_i \) is isomorphic to \( V(l(\Lambda_n - \Lambda_0)) \) as an \( U_q(g_{l\setminus\{i_0\}}) \)-module and is isomorphic to \( V(l(\Lambda_0 - \Lambda_n)) \) as an \( U_q(g_{l\setminus\{n\}}) \)-module.

The last statement follows from the fact that the Weyl group of \( C_n \) contains \(-1\).

5.3. \((D_n^{(1)}, V(l(\Lambda_n - \Lambda_0))).\) Let \( g \) be of type \( D_n^{(1)} \) and take \( I, i_0 \) as in 4.3. In 4.3 we constructed the polarized \( U_q(g) \)-module \( V \). As a \( U_q(g_{l\setminus\{i_0\}}) \)-module \( V \) is isomorphic to \( V(\Lambda_n - \Lambda_0) \). It is obvious that \( V_{k_{\lambda}} \) as in 6.1 exists. Hence taking \( \lambda_1 = \lambda_n - \lambda_0 \), the condition (3.1.1) is satisfied. We have, by Proposition 4.3.5,

\[ \varphi(z) = \prod_{j=1}^{N_n} (1 - q^{4j-2}z), \]

where \( N_n \) is the largest integer which does not exceed \( n/2 \). Therefore, if we set

\[(5.3.1)\]

\[ r = 1, \]

then the condition (3.3.4) is satisfied. We have

\[ R(q^{2r}) = \varphi(q^{2r})P_{2\lambda_0}. \]

Hence we have by (3.3.9), [KN], and Proposition 3.4.4, the following.

**Proposition 5.3.1.**

(i) \( V_i \) has a crystal pseudobase.

(ii) \( V_i \) is an irreducible \( U_q(g_{l\setminus\{i_0\}}) \)-module with highest weight \( l(\Lambda_n - \Lambda_0) \) and an irreducible module with highest weight \( l(\Lambda_0 - \Lambda_n) \) or \( l(\Lambda_1 - \Lambda_n) \) as an \( U_q(g_{l\setminus\{n\}}) \)-module according that \( n \) is even or odd.

(ii) follows from the fact that \( \Lambda_0 - \Lambda_n \) or \( \Lambda_1 - \Lambda_n \) is in the Weyl group orbit of \( \Lambda_n - \Lambda_0 \) according to the parity of \( n \).

5.4. \((D_n^{(1)}, V(l(\Lambda_1 - \Lambda_0))).\) Let \( g \) be of type \( D_n^{(1)} \) and take \( I \) as in 4.4 and \( i_0 = 0 \). Let \( V \) be the polarized \( U_q(g) \)-module constructed in 4.4. Then \( V \) is isomorphic to \( V(\Lambda_1 - \Lambda_0) \) as an \( U_q(g_{l\setminus\{0\}}) \)-module. Hence taking \( \Lambda_1 - \Lambda_0 \) as \( \lambda_0 \), the condition (3.1.1) is satisfied. By Proposition 4.4.3, we have

\[ \varphi(z) = (1 - q^2z)(1 - q^{2n-2}z). \]
We set

\[(5.4.1) \quad r = 1.\]

Then the condition (3.3.4) is satisfied, and

\[(5.4.2) \quad R(q^{2r}) = \varphi(q^{2r})P_{2\lambda_0}.\]

Thus we obtain, by (3.3.9), [KN], and Proposition 3.4.4, the following.

**Proposition 5.4.1.** (i) \(V_i\) is an irreducible module with highest weight \(l(\Lambda_1 - \Lambda_0)\) as a \(U_q(g_{L(\{0\})})\)-module.

(ii) \(V_i\) has a crystal pseudobase.

5.5. \((B_n^{(1)}, V(l(\Lambda_1 - \Lambda_0)))\). Let \(g\) be of type \(B_n^{(1)}\) and \(I, i_0 = 0\), as in 4.5. We constructed in 4.5, the polarized \(U_q(g)\)-module \(V\). It is an irreducible module with highest weight \(\Lambda_1 - \Lambda_0\) as an \(U_q(g_{L(\{0\})})\)-module. Hence taking \(\Lambda_1 - \Lambda_0\) as \(\lambda_0\), the condition (3.1.1) is satisfied. We have, by Proposition 4.5.3,

\[\varphi(z) = (1 - q^4z)(1 - q^{4n-2}z).\]

Set

\[(5.5.1) \quad r = 2.\]

Then the condition (3.3.4) is satisfied and

\[(5.5.2) \quad R(q^{2r}) = \varphi(q^{2r})P_{2\lambda_0}.\]

Hence by (3.3.9), [KN], and Proposition 3.4.4, we obtain the following result.

**Proposition 5.5.1.** (i) \(V_i\) is an irreducible module with highest weight \(l(\Lambda_1 - \Lambda_0)\) as an \(U_q(g_{L(\{0\})})\)-module.

(ii) \(V_i\) has a crystal pseudobase.

5.6. \((A_{2n-1}^{(2)}, V(l(\Lambda_1 - \Lambda_0)))\). Let \(g\) be of type \(A_{2n-1}^{(2)}\) and \(I, i_0 = 0\) as in 4.6, where we constructed the polarized \(U_q(g)\)-module \(V\). It is an irreducible module with highest weight \(\Lambda_1 - \Lambda_0\) as an \(U_q(g_{L(\{0\})})\)-module. Hence taking \(\lambda_0 = \Lambda_1 - \Lambda_0\), the condition (3.1.1) is satisfied. We have by Proposition 4.6.3

\[\varphi(z) = (1 - q^2z)(1 - q^{2n}z).\]

We set

\[(5.6.1) \quad r = 1.\]
Then the condition (3.3.4) is satisfied and
\[ R(q^{2r}) = \varphi(q^{2r})P_{2\lambda_0}. \]
Hence by (3.3.9), [KN], and Proposition 3.4.4, we have the following result.

**Proposition 5.6.1.**

(i) \( V_t \) is an irreducible module with highest weight \( l(\Lambda_1 - \Lambda_0) \) as an \( U_q(\mathfrak{gl}_{\{l\}}) \)-module.

(ii) \( V_t \) has a crystal pseudobase.

5.7. \( A^{(2)}_{2n}, \bigoplus_{0 \leq k \leq l/2} V((l - 2k)(\Lambda_{n-1} - \Lambda_n)) \). Let \( g \) be of type \( A^{(2)}_{2n} \) and \( I, i_0 = n \) as in 4.7, where we constructed the polarized \( U_q(g) \)-module \( V \). It is an irreducible module with highest weight \( \Lambda_{n-1} - \Lambda_n \) as \( U_q(\mathfrak{gl}_{\{n\}}) \)-module. Hence taking \( \Lambda_{n-1} - \Lambda_n \) as \( \lambda_0 \) the condition (3.1.1) is satisfied. Note that

\[(5.7.1) \quad \alpha_n = 2(\Lambda_n - \Lambda_{n-1}).\]

We have, by Proposition 4.7.1,

\[(5.7.2) \quad \varphi(z) = (1 - q^4z)(1 + q^{4n+2}z).\]

We set

\[(5.7.3) \quad r = 2.\]

Then the condition (3.3.4) is satisfied, and

\[(5.7.4) \quad R(q^{2r}) = (1 - q^8)((1 + q^{4n+6})P_{2\lambda_0} + (q^4 + q^{4n+2})P_0),\]

where \( P_\lambda \) is the \( U_q(\mathfrak{gl}_{\{n\}}) \)-linear projector to \( V(\lambda) \). We set, as in Section 3,

\[(5.7.5) \quad V_t = \text{Im } R_t.\]

In order to apply Proposition 3.4.5, we shall prove

\[(5.7.6) \quad \dim(V_t)_\lambda \leq \sum_{0 \leq k \leq l/2} \dim V((l - 2k)(\Lambda_{n-1} - \Lambda_n))_\lambda \]

for any \( \lambda \). Let \( W \) be the kernel of \( R(q^{2r}) \). Set \( U = V(\bigoplus_{i=0}^{l/2} V(\bigoplus_i \otimes W \otimes V(\bigoplus_{i=0}^{l/2} - i - 2)). \) Then by (3.3.10), \( V_t \) is a quotient of \( U \). Hence

\[ \dim(V_t)_\lambda \leq \dim U_\lambda. \]

Set \( S(q) = (1 + q^{4n+6})P_{2\lambda_0} + (q^4 + q^{4n+2})P_0 \). Then \( R(q^2) = (1 - q^8)S \). Then at \( q = 1 \), \( U \) is isomorphic to \( S'(V) \). Thus \( \dim U_\lambda \) is equal or less than the weight
multiplicity of $U_q(\mathfrak{gl}_{n+1}(\mathbb{C}))$-module $S^i(V)$. Setting $\varepsilon_i = \Lambda_i - \Lambda_{i+1}$, ch $V = 1 + \sum_{0 \leq i \leq n-1} (e^{\varepsilon_i} + e^{-\varepsilon_i})$. Thus we obtain

$$\sum_l \text{ch}(S^l V) t^l = \frac{1}{(1-t) \prod_{0 \leq i \leq n-1} (1-e^{\varepsilon_i} t)(1-e^{-\varepsilon_i} t)}$$

This implies

$$\sum_l \text{ch}(V_l) t^l \leq \frac{1}{(1-t) \prod_{0 \leq i \leq n-1} (1-e^{\varepsilon_i} t)(1-e^{-\varepsilon_i} t)}$$

This means that the coefficient of $e^{\lambda_k} t^k$ ($\lambda \in \mathbb{P}$, $0 \leq k$) of the left-hand side is less than or equal to that of the right-hand side.

**Lemma 5.7.1.**

$$\frac{1}{(1-t) \prod_{0 \leq i \leq n-1} (1-e^{\varepsilon_i} t)(1-e^{-\varepsilon_i} t)} = \sum_{0 \leq 2k \leq l} \text{ch}(V((l-2k)(\Lambda_{n-1} - \Lambda_n))) t^l.$$

**Proof.** Let us first calculate the character of $V(j(\Lambda_{n-1} - \Lambda_n))$. By [KN], crystal bases of $V(j(\Lambda_n - \Lambda_0))$ consists of $a_1 \otimes \cdots \otimes a_j$ where $1 \leq a_1 \leq \cdots \leq a_j \leq \bar{1}$. Here $a_1, \ldots, a_j$ are elements of $\{1, 2, \ldots, n, \bar{n}, \ldots, \bar{1}\}$ with the ordering $1 \leq 2 \leq \cdots \leq n < 0 < \bar{n} \leq \cdots \leq \bar{1}$. Moreover, $0$ does not appear more than once in $a_1, \ldots, a_j$. Note that $i$ has weight $\varepsilon_i$, $\bar{i}$ has weight $-\varepsilon_i$ and $0$ has weight $0$. Thus we have

$$\sum_l \text{ch}(V(j(\Lambda_{n-1} - \Lambda_n))) t^l = \frac{1+t}{\prod (1-e^{\varepsilon_i} t)(1-e^{-\varepsilon_i} t)}.$$ 

Thus we have the desired result. □

As a corollary of this lemma, we obtain (5.7.6). Thus we can apply Proposition 4.4.5, and we obtain the following result.

**Proposition 5.7.2.** (i) $V_l$ has a crystal pseudobase.

(ii) $V_l$ is isomorphic to

$$\bigoplus_{0 \leq k \leq l/2} V((l-2k)(\Lambda_{n-1} - \Lambda_n))$$

as a $U_q(\mathfrak{gl}_{n+1}(\mathbb{C}))$-module.

5.8. (D^{(2)}_{n+1}, \bigoplus_{j=0} V(j(\Lambda_1 - 2\Lambda_0))) Let $g$ be of type $D^{(2)}_{n+1}$ and $I, i_0$ as in 4.8, where we constructed the polarized $U_q(g)$-module $V$. This is isomorphic to $V(\Lambda_1 - 2\Lambda_n) \oplus V(0)$ as a $U_q(\mathfrak{gl}_{n+1}(\mathbb{C}))$-module. This admits a $V_{\lambda_0}$ and taking $\lambda_0 = \Lambda_1 - 2\Lambda_0$, the condition (3.1.1) is satisfied. By Proposition 4.8.3, we have

$$\varphi(z) = (1 - q^4 z^2)(1 - q^{4n} z^2).$$
Let us take

\[(5.8.2)\quad r = 1.\]

Then the condition (3.3.4) is satisfied. By the calculation, \(N = \text{Ker}(q^{2r})\) contains \(u_{\Lambda_2}, u_{\Lambda_1}^1, u_{\Lambda_1}^2\), and \(q(1 + q^2)(1 + q)u_0^1 - (1 - q^{2n+2})(1 - q)^{-1}u_0^2\). Hence by Lemma 4.8.1, at \(q = 1\), \(N\) contains \((\cdot) \wedge (V(\Lambda_1), \Lambda^2 V(\Lambda_1))\) and \((\cdot) \otimes (\cdot) + u\), where \(u\) is an element of \(V(\Lambda_1) \otimes V(\Lambda_1)\). Hence

\[V^{\otimes l}(\sum V^{\otimes j} \otimes N \otimes V^{\otimes (n-2-l)})\]

is generated by \(S^l(V(\Lambda_1))\) and \((\cdot) \otimes S^{-1}(V(\Lambda_1))\). Hence we obtain

\[
\sum \text{ch}(V_j) t^l \leq \sum \text{ch} S^j(V(\Lambda_1)) t^j + \sum \text{ch} S^j(V(\Lambda_1)) t^{j+1} = (1 + t) \sum \text{ch} S^j(V(\Lambda_1)) t^j,
\]

\[= \frac{1 + t}{(1 - t) \prod_{j=1}^l (1 - e^{\delta t})(1 - e^{-\delta t})}.\]

On the other hand, by (5.7.6)

\[
\sum_{0 \leq j \leq l} \text{ch} V(j(\Lambda_1 - 2\Lambda_0)) t^j = \frac{1 + t}{(1 - t) \prod (1 - e^{\delta t})(1 - e^{-\delta t})}.
\]

Thus we obtain

\[\dim(V_\lambda) \leq \sum_{j=0}^l \dim V(j(\Lambda_1 - 2\Lambda_0)) \lambda\]

for any \(\lambda\). Thus we can apply Proposition 3.4.5, and we obtain the following results.

**Proposition 5.8.1.**

(i) \(V_l\) has a crystal pseudobase.

(ii) \(V_l\) is isomorphic to \(\bigoplus_{j=0}^l V(j(\Lambda_1 - 2\Lambda_0))\) as a \(U_q(q(\mathfrak{g}_{\Lambda\setminus\{0\}}))\)-module.

5.9. \((D^{(2)}_{n+1}, V(l(\Lambda_n - \Lambda_0)))\). Let \(g\) be of type \(D^{(2)}_{n+1}\) and \(l, i_0 = 0\) as in 4.9, where we constructed the polarized \(U_q(q(\mathfrak{g}))\)-module \(V\) and calculated its \(R\)-matrix. This \(V\) is isomorphic to \(V(\Lambda_n - \Lambda_0)\) as a \(U_q(q(\mathfrak{g}_{\Lambda\setminus\{0\}}))\)-module. Hence setting \(\lambda_0 = \Lambda_n - \Lambda_0\), the condition (3.1.1) is satisfied. We have, by Proposition 4.9.5,

\[(5.9.1)\quad \phi(z) = \prod_{i=1}^n (1 + (-1)^i q^{2(l+2)z}).\]

Hence setting

\[(5.9.2)\quad r = 3,\]
the condition (3.3.4) is satisfied, and

\[ R(q^{2r}) = \varphi(q^{2r})P_{2\lambda_0}. \]

Thus by (3.3.9), [KN], and Proposition 3.4.4, we have the following result.

**Proposition 5.9.1.** For \( l \geq 1 \) there exists a \( U_q'(\mathfrak{g}) \)-module \( V_l \) such that

(i) \( V_l \) has a crystal pseudobase, and

(ii) \( V_l \) is isomorphic to \( V(l(\Lambda_n - \Lambda_0)) \) as a \( U_q(\mathfrak{g}_l(\{0\})) \)-module.

6. **Perfectness of the graphs.** In this section we prove the perfectness of the crystals introduced in Section 1, whose representations have been constructed in Section 5.

Let \( U_q'(\mathfrak{g}) \) and \( U_q'(\mathfrak{g}') \) be quantum universal enveloping algebras with \( I \) and \( I' \) as index sets of simple roots and with \( A \) and \( A' \) as generalized Cartan matrices. Suppose that a map \( : I \to I' \) satisfies \( (A)_{i,j} = (A')_{i',j'} \). If \( B' \) is a crystal for \( U_q'(\mathfrak{g}') \), we make a crystal \( B \) for \( U_q'(\mathfrak{g}) \) by putting \( B = B' \) as a set and drawing a \( j \) arrow from \( b \) to \( b' \) if and only if there is an \( i(j) \) arrow from \( b \) to \( b' \). We denote the identity map from \( B' \) to \( B \) also by \( i^* \).

6.1. **\( \text{sl}(2) \)-crystals.** Here we give the rule of arrow in tensor products of \( \text{sl}(2) \)-crystals. We denote by \( I = \{1\} \) the index set of the simple root for \( \text{sl}(2) \). For \( j \in \mathbb{Z}/2 \), let

\[ B(j) = \{u_m(j) \mid -j \leq m \leq j, m \in j + \mathbb{Z}\} \]

be the crystal of the \((2j + 1)\)-dimensional irreducible \( \text{sl}(2) \)-module. The arrows in \( B(j) \) are

\[ u_m(j) \stackrel{1}{\rightarrow} u_{m-1}(j) \quad (-j < m \leq j). \]

We abbreviate \( u_0(0), u_{1/2}(1/2), u_{-1/2}(1/2) \) by \( 0, +, - \), respectively. The following proposition is immediate and is useful to describe the arrows in tensor products of \( \text{sl}(2) \)-crystals.

**Proposition 6.1.1.** Let \( B_1, B_2 \) be crystals for \( U_q(\text{sl}(2)) \). The following are morphisms of crystals.

\[ B_1 \otimes B_2 \rightarrow B_1 \otimes B(0) \otimes B_2 \]

(6.1.2)

\[ \psi \quad \psi \quad b_1 \otimes b_2 \mapsto b_1 \otimes 0 \otimes b_2, \]
\( B_1 \otimes B_2 \rightarrow B_1 \otimes B(1/2) \otimes B(1/2) \otimes B_2 \)

\[(6.1.3)\]

\[b_1 \otimes b_2 \mapsto b_1 \otimes + \otimes - \otimes b_2,, \]

\[B(j) \rightarrow B(1/2)^{(2j)} \]

\[(6.1.4)\]

\[u_m(j) \mapsto - \otimes \cdots \otimes - \otimes + \otimes \cdots \otimes +. \]

For example, the following is a string of 1-arrows in \( B(1/2)^{\otimes 4} \otimes B(0) \otimes B(1/2)^{\otimes 2}. \)

\[
+ \otimes + \otimes + \otimes - \otimes 0 \otimes - \otimes + \quad \downarrow 1 \\
- \otimes + \otimes + \otimes - \otimes 0 \otimes - \otimes + \quad \downarrow 1 \\
- \otimes + \otimes + \otimes - \otimes 0 \otimes - \otimes -
\]

The following proposition follows from \([KN]\).

**PROPOSITION 6.1.2.** Take

\[(6.1.5)\]

\[b = (+)^{\otimes x_1} \otimes (-)^{\otimes y_1} \otimes \cdots \otimes (+)^{\otimes x_k} \otimes (-)^{\otimes y_k} \]

in \( B(1/2)^{\otimes M} \) where \( M = \sum_{j=1}^{k} (x_k + y_k) \). Then

\[(6.1.6)\]

\[\text{wt} \ b = \sum_{j=1}^{k} (x_j - y_j) \Lambda_1, \]

\[(6.1.7)\]

\[e_1(b) = \sum_{j=1}^{k} (p_j)^+, \]

\[(6.1.8)\]

\[\varphi_1(b) = (-p_k)^+, \]

where the \( p_j \) are defined inductively by

\[(6.1.9)\]

\[p_0 = 0, \quad p_j = y_j - x_j - (-p_{j-1})^+, \]
and

\[ x_+ = x \quad \text{if } x \geq 0 \]
\[ = 0 \quad \text{if } x < 0. \]

We omit the proof.

6.2. \( \mathfrak{sl}(n + 1) \)-crystals. We use the description of crystals for \( U_q(\mathfrak{sl}(n + 1)) \) given by [KN]. We recollect some of their results here.

Let \( \Lambda = \lambda_{k_1} + \cdots + \lambda_{k_t} (n \geq k_1 \geq \cdots \geq k_t > 0) \) be a dominant integral weight for \( \mathfrak{sl}(n + 1) \). We consider \( B(\Lambda) \), the crystal for \( U_q(\mathfrak{sl}(n + 1)) \) associated with the irreducible representation with highest weight \( \Lambda \). The crystal \( B(\Lambda) \) is given as follows. Let \( Y \) be the Young diagram with the columns of length \( k_1, \ldots, k_t \). We identify \( Y \) with the set of pairs of integers \((j, j')\) such that \( 1 \leq j \leq k_f, 1 \leq j' \leq l \). Then \( B(\Lambda) \) consists of the maps

\[
\begin{align*}
& b : Y \rightarrow \{1, \ldots, n + 1\}, \\
& (j, j') \mapsto b_{j, j'}
\end{align*}
\]

(6.2.1)

satisfying \( b_{j, j'} \leq b_{j, j' + 1} \) and \( b_{j, j'} < b_{j + 1, j'} \). We call this \( b \) a standard tableau, as usual.

Fix \( i \), let \( \phi_i : \{1\} \rightarrow J \) be the map given by \( \phi_i(1) = i \), and let \( B_i = \phi_i^*(B(\Lambda)) \). We are going to give the arrows in \( B_i \). Set \( \overline{B} = \bigoplus B_i \) where the sum ranges over the maps \( d : \{1, \ldots, M\} \rightarrow \{0, 1/2\} \) and \( B_d = B(d(1)) \otimes \cdots \otimes B(d(M)) \). Define \( \tau : B_i \rightarrow \overline{B} \) as follows. For a given \( b \in B(\Lambda) \), we shall define \( d = (d(1), \ldots, d(M)) \) and \( \tau(b) = s_1 \otimes \cdots \otimes s_M \in B_d \). Suppose that \((j, j') \in Y \) is the \( m \)-th element in the sequence

\[
\begin{align*}
(1, l), (2, l), \ldots, (k_t, l), \\
(1, l-1), (2, l-1), \ldots, (k_{t-1}, l-1), \\
\vdots \\
(1, 1), (2, 1), \ldots, (k_1, 1).
\end{align*}
\]

Then we define

\[
\begin{align*}
d(m) &= 1/2 \quad \text{if } b_{j, j'} = i \text{ or } i + 1 \\
&= 0 \quad \text{otherwise}, \\
s(m) + &= \quad \text{if } b_{j, j'} = i \\
&= - \quad \text{if } b_{j, j'} = i + 1 \\
&= 0 \quad \text{otherwise}.
\end{align*}
\]

(6.2.3)
The map \( \tau \) is a morphism of crystals, and the \( i \)-arrows in \( B(\Lambda) \) can be read from the \( 1 \)-arrows in \( \widetilde{B} \) by using Proposition 6.1.2.

It is convenient to use a different labeling of \( B(l\Lambda_k) \). Let \( \Lambda \) be a corresponding weight of a Young Diagram \( Y = (l_1, \ldots, l_n) \).

Consider the set of tables of nonnegative integers \( (x_{j,i})_{1 \leq j \leq n, 1 \leq i \leq n+1} \) such that

\[
\sum_i x_{j,i} = l_j \quad (1 \leq j \leq n),
\]

\[
\sum_{i' \leq l} x_{j,i'} \geq \sum_{i' \leq l} x_{j+1,i'+1} \quad (1 \leq j \leq n, 1 \leq i \leq n).
\]

We denote this set by \( X(\Lambda) \). Define the map

\[
x : B(\Lambda) \to X(\Lambda)
\]

by

\[
x(b) = (x_{j,i})
\]

\[
\begin{align*}
\text{by} & \\
(6.2.7) & \\
x_{j,i} = \# \{ j' \mid b_{j,j'} = i \}.
\end{align*}
\]

The following is immediate.

**PROPOSITION 6.2.1.** The map \( x \) given by (6.2.6–6.2.7) is bijective. The weight of \( b \) is given by

\[
\text{wt } b = \sum_{i=1}^{n+1} \sum_{j=1}^{k} x_{j,i}(\Lambda_i - \Lambda_{i-1}).
\]

Here we set \( \Lambda_0 = \Lambda_{n+1} = 0 \).

For \( b, b' \in B(\Lambda) \) we write \( b \lessdot b' \) if and only if \( b' = \tilde{f}_i b \) and \( \tilde{f}_j b' = 0 \). We also write \( b \lessdot b' \) if and only if \( b' = \tilde{e}_i b \) and \( \tilde{e}_j b' = 0 \). Note that \( b \lessdot b' \) and \( b' \lessdot b \) are not equivalent. If \( b \lessdot b' \), then \( r = q_0(b) \). If \( b' \lessdot b \), then \( r = e_i(b') \).

Now set \( B = B(\Lambda) \) where \( \Lambda \) is a dominant integral weight of \( \text{sl}(n+1) \). Consider the sequence

\[
\begin{align*}
1, 2, \ldots, n - 1, n, \\
1, 2, \ldots, n - 1, \\
\vdots \\
1, 2, \\
1,
\end{align*}
\]
For \( b \in B \) we define \( r_{j,i} \in \mathbb{Z}_{\geq 0} \) and \( b(j, i) \in B(1 \leq i \leq n + 1 - j) \) in such a way that
\[
1_{r_{1,1}} b(1, 1) \Rightarrow 2_{r_{1,2}} \cdots n_{r_{1,n}} b(1, n) \Rightarrow b(2, n - 1) \Rightarrow \cdots \Rightarrow b(n - 1, 2) \Rightarrow b(n, 1).
\]

Then we have the following result.

**PROPOSITION 6.2.2.** The last element \( b(n, 1) \) is the lowest-weight element in \( B \), and

\[
(6.2.8) \quad r_{j,i} \leq r_{j-1,i+1}.
\]

If we replace the arrow \( \Leftarrow \) with \( \Rightarrow \), then the last element \( b(n, 1) \) is the highest-weight element in \( B \), and we have \((6.2.8)\).

**Proof.** Because of the symmetry \( e_i \leftrightarrow f_i, e^k \leftrightarrow e^{-k} \) of \( U_q(\mathfrak{sl}(n + 1)) \), it is enough to prove the case for \( \Leftarrow \). We call the subset of \( Y \) given by \( \{(r, i) \in Y | b_{r,i} = s \} \) the \((r, s)\)-block of \( b \). The value of \( b(j, i) : Y \rightarrow \{1, \ldots, n + 1\} \) is constant on each \((r, s)\)-block. More precisely, for \( b' \Rightarrow b'' \), we have
\[
b''|_{(r,s)\text{-block}} = b'|_{(r,s)\text{-block}} - 1 \quad \text{if } j + i = s, 1 \leq j \leq s - r,
\]
\[
= b'|_{(r,s)\text{-block}} \quad \text{otherwise}.
\]

Namely, the value of the \((r, s)\)-block decreases one-by-one in the process of \( \Rightarrow \) at \((j, i) = (1, s - 1), \ldots, (s - r, r)\). Therefore, we have \( b(n, 1)|_{(r,s)\text{-block}} = r \) and \( r_{j,i} = \sum 1 \leq j \leq s j \). The assertion immediately follows from this. \( \square \)

In the following subsections, we shall give the proofs of the results in Section 1. Note that in those proofs we may only estimate \( \langle c, e(b) \rangle \) but \( \langle c, \varphi(b) \rangle \) by considering duals of crystals (see \( \text{[KMN]}^2 \), §5).

6.3. \((A_n^{(1)}, B(l\Lambda_k)) (n \geq 2, 1 \leq k \leq n)\). We shall use the notations in 1.2.

**PROPOSITION 6.3.1.** Let \( J' = \{1, \ldots, n - 1\} \) be the index set of the simple roots for \( U_q(\mathfrak{sl}(n)) \) and let \( i' : J' \rightarrow J \) be \( i'(j) = j \). Set \( B' = i'^*(B(l\Lambda_k)) \). The crystal \( B' \) splits into \( l + 1 \) connected components.

\[
(6.3.1) \quad B' = \bigoplus_{m=0}^l B(m\Lambda_k + (l - m)\Lambda_{k-1}).
\]
Here we mean \( \Lambda_n = \Lambda_0 = 0 \). If \( B_1 \) and \( B_2 \) are both isomorphic to \( B' \), then the isomorphism \( B_1 \to B_2 \) is unique.

**Proof.** An element \( b \in B(l\Lambda_k) \) corresponds to a highest-weight element in \( B' \) if and only if

\[
\begin{align*}
b_{j,j'} &= j & (1 \leq j \leq k - 1, 1 \leq j' \leq l), \\
b_{k,j'} &= k & (1 \leq j' \leq m) \\
n + 1 &= n + 1 & (m + 1 \leq j' \leq l),
\end{align*}
\]

for some \( 0 \leq m \leq l \). The weight of \( i^*(b) \) is \( m\Lambda_k + (l - m)\Lambda_{k-1} \). Hence we have (6.3.1). The uniqueness of the isomorphism \( B_1 \to B_2 \) follows from the fact that the highest weights of the connected components of \( B' \) are all different. \( \square \)

Set

\[ k' = n + 1 - k \]

**Proof of Proposition 1.2.1.** The existence of \( B^{k,i} \) is proved in Section 5. Let us prove the uniqueness. Suppose that \( B_1 \) and \( B_2 \) are crystals of \( U_q(\hat{\mathfrak{sl}}(n + 1)) \) such that \( i^*(B_1) = i^*(B_2) = B(l\Lambda_k) \) for \( i = 0, n \). Let \( \tau^{(i)}: i^*(B_1) \to i^*(B_2) \) \( (i = 0, n) \) be the isomorphisms of \( \mathfrak{sl}(n + 1) \)-crystals. By Proposition 6.3.1 we have \( \tau^{(0)} = \tau^{(n)} \) as a morphism of \( \mathfrak{sl}(n + 1) \)-crystal and these maps can be extended to the isomorphism \( \tau: B_1 \to B_2 \) such that \( \tau|_{i^*(B_1)} = \tau^{(i)} \). \( \square \)

The proof of Theorem 1.2.2 is divided into several parts. Without loss of generality, we can assume that \( k \leq k' \). For \( b \in B^{k,i} \) we set \( (x_{j,i}) = x(i^*(b)) \). For convenience we set \( x_{0,0} = l, x_{0,1} = \cdots = x_{0,n+1} = 0 \) and \( x_{k+1,0} = \cdots = x_{k+1,n+1} = 0 \). The following is immediate from Proposition 6.1.2.

**Proposition 6.3.2.**

\[
\begin{align*}
\varepsilon_i(b) &= \sum_{j=1}^{k} (p_{j,i})_+ \\
\varphi_i(b) &= (-p_{k+1,i})_+
\end{align*}
\]

where \( p_{j,i} \) \( (0 \leq j \leq k + 1, 1 \leq i \leq n) \) are defined inductively by

\[
p_{0,i} = 0, \quad p_{j,i} = x_{j-1,i} - x_{j-1,i} - (-p_{j-1,i})_+.
\]

**Proposition 6.3.3.** For \( b \in B \) we have

\[
\sum_{i=1}^{n} \varepsilon_i(b) \geq l - x_{k,k}.
\]

The equality holds if and only if \( p_{i,i} \geq 0 \) \( (2 \leq i \leq k) \) and \( p_{k,i} \geq 0 \) \( (k + 1 \leq i \leq n - 1) \).
Proof. Note that \(p_{j,i} \leq 0\) if \(j > i\), and also that \(p_{k,n} \geq 0\). We have \(\varepsilon_i(b) = x_{1,2}\). For \(2 \leq i \leq k\), by use of \(x_+ - (-x)_+ = x\) we have

\[
\varepsilon_i(b) = \sum_{j=1}^{i-1} (p_{j,i})_+ + p_{i,i} = \sum_{j=1}^{i-1} (p_{j,i})_+ + x_{i,i+1} - x_{i-1,i} - (-p_{i-1,i})_+ = \sum_{j=1}^{i-2} (p_{j,i})_+ + p_{i-1,i} + x_{i,i+1} - x_{i-1,i} = \sum_{j=1}^{i} (x_{j,i+1} - x_{j-1,i}).
\]

For \(k + 1 \leq i \leq n\), we have

\[
\varepsilon_i(b) = \sum_{j=1}^{k} (p_{j,i})_+ \geq \sum_{j=1}^{k-1} (p_{j,i})_+ + p_{k,i} = \sum_{j=1}^{k} (x_{j,i+1} - x_{j-1,i}).
\]

Therefore, we have

\[
\sum_{i=1}^{n} \varepsilon_i(b) \geq x_{k,k+1} + \cdots + x_{k,n+1} = l - x_{k,k}.
\]

We set \((x_{j,i}') = x(i^{(b)}(b))\). Define

\[
(l_j) = \sum_{i=j}^{k} x_{j,i}, \quad (0 \leq j \leq k), \quad (l'_j) = \sum_{i=j}^{k} x_{j,i}' \quad (0 \leq j \leq k').
\]

These integers are the same for \(b\) and \(b'\) if \(b \Rightarrow b'\) for some \(i \neq 0, k\). Note that \(l_0 = l'_0 = l\). We are going to show the following proposition.

**Proposition 6.3.4.**

\[
l_i' = l - l_{k+1-i} \quad \text{if} \quad 1 \leq i \leq k + 1
\]

\[
= 0 \quad \text{if} \quad k + 1 \leq i \leq k'.
\]

Proof. Define \(b \in B^{k,l}\) by \((x_{j,i}) = x(b)\) where

\[
\begin{align*}
x_{1,1} &= l_1, & x_{1,2} = \cdots = x_{1,k} &= 0, & x_{1,k+1} &= l - l_1, \\
x_{2,2} &= l_2, & x_{2,3} = \cdots = x_{2,k} &= 0, & x_{2,k+1} &= l_1 - l_2, & x_{2,k+2} &= l - l_1, \\
&\vdots & & & & \\
x_{k,k} &= l_k, & x_{k,k+1} &= l_{k-1} - l_k, & x_{k,2k} &= l - l_1.
\end{align*}
\]
Then $i^{(0,k)*}(\tilde{b})$ is the highest-weight element in the connected component of the crystal $i^{(0,k)*}(B^{k,1})$ that contains $i^{(0,k)*}(b)$. By Proposition 6.2.1 the weight of $\tilde{b}$ is given by

$$\Lambda = \sum_{j=1}^{k-1} (l_j - l_{j+1})(\Lambda_j + \Lambda_{2k-j}) + (2l_k - l_1)\Lambda_k + (l - l_1)\Lambda_{2k} - l_1\Lambda_0.$$ 

Therefore, the weight of $i^{(k)*}(\tilde{b})$ is

$$\overline{\Lambda} = \sum_{j=1}^{k-1} (l_j - l_{j+1})(\Lambda_{k-j} + \Lambda_{n+1-\kappa+j}) + (l - l_1)\Lambda_k - l_1\Lambda_k.$$ 

On the other hand, in terms of $l'_j$, $\overline{\Lambda}$ reads as

$$\overline{\Lambda} = \sum_{j=1}^{k-1} (l'_j - l'_{j+1})(\Lambda_i - \Lambda_{n+1-i}) - (l - l'_k)\Lambda_k + l'_k\Lambda_{k'}.$$ 

Comparing these two expressions of $\overline{\Lambda}$, we get the assertion. □

**Proposition 6.3.5.** For $b \in B^{k,1}$ we have

$$e_0(b) \geq x_{k,k}.$$ 

The equality holds if and only if $p_j' \leq 0$ for $2 \leq j \leq k$ where $p_j'$ are defined inductively by

$$p_0' = 0, \quad p_j' = x_{j,k+1} - x_{j-1,k} - (-p_j'_{-1})_+.$$ 

**Proof.** From Proposition 6.3.4 we have $l'_1 = l - l_k = l - x_{k,k}$. Therefore, we have

$$e_0(b) = e_k(i^{(k)*}(b)) = \sum_{j=1}^{k} (p_j')_+ \geq x'_{1,k+1} = l - l'_1 = x_{k,k}.$$ 

From Proposition 6.3.5 and 6.3.7 we have the following corollary.

**Corollary 6.3.6.** For $b \in B^{k,1}$ we have $\sum_{i=0}^{n} e_i(b) \geq l$.

Since $c = \sum_{i=0}^{n} h_i$, $b$ is minimal if and only if $\sum_{i=0}^{n} e_i(b) = l$. 

**Proposition 6.3.7.**

\[ x'_{j,k} = l_{k-j} - l_{k-j+1} - r_{1,j} + r_{1,j+1} \quad \text{if } 1 \leq j \leq k - 1 \]

\[ = l - l_1 \quad \text{if } j = k \]

\[ = 0 \quad \text{if } k + 1 \leq j \leq k' \]

\[ x'_{j,k+1} = l_k \quad \text{if } j = 1 \]

\[ = r_{k+2-j,n+2-j} - r_{k+1-j,n+1-j} \quad \text{if } 2 \leq j \leq k \]

\[ = r_{1,k'} \quad \text{if } j = k + 1 \]

\[ = 0 \quad \text{if } k + 2 \leq j \leq k'. \]

**Proof.** We connect \((x'_{j,i})\) and \((x_{j,i})\) in the following scheme.

\[ i^{(0,k)}(b) \xrightarrow{f_{i,s}} i^{(0,k)}(b): \text{the lowest-weight element in } i^{(0,k)}(B^{k,l}) \]

(6.3.5) \[ \xrightarrow{\text{Proposition 6.3.4}} \]

\[ i^{(0,k)}(b) \xrightarrow{\epsilon_{i,t}} i^{(0,k)}(b): \text{the lowest-weight element in } i^{(0,k)}(B^{k,l}). \]

We use \(l_j\) and \(l'_j\) of (6.3.3). We set formally \(l_{k+1} = 0\). Let \(b \in B^{k,l}\) be given by \((y_{j,i}) = x(i^{(0)}(b))\) where

\[ y_{j,i} = l_{k+j-i} - l_{k+j-i+1} \quad \text{if } j \leq i \leq k \]

\[ = 0 \quad \text{if } k + 1 \leq i \leq k' + j - 1 \]

\[ = l - l_j \quad \text{if } i = k' + j. \]

Then \(i^{(0,k)}(b)\) is the lowest-weight element in the connected component of \(i^{(0,k)}(B^{k,l})\) that contains \(i^{(0,k)}(b)\). Set \((z_{j,i}) = x(i^{(0)}(b))\). Note that \(i^{(0)}(B^{k,l}) = B(l\Lambda_k)\). We have

(6.3.6) \[ z_{j,i} = l'_{k+j-i} - l'_{k+j-i+1} \quad \text{if } j \leq i \leq k = l_{i-j} - l_{i-j+1} \]

\[ = 0 \quad \text{if } k + 1 \leq i \leq k + j - 1 \]

\[ = l - l'_j = l_{k+1-j} \quad \text{if } i = k + j. \]
By Proposition 6.2.2, $b$ is obtained from $b$ by the process

\[(6.3.7) \quad b^{k-1, r_{k-1}, k-1} \Rightarrow b(k - 1, k - 1) \Rightarrow b^{k-2, r_{k-2}, k-2} \cdots 2, r_{2, 2} \Rightarrow b(2, 2) \Rightarrow b^{1, r_{1, 1}}(1, 1)
\]

\[\Rightarrow b(k - 2, k - 1) \Rightarrow b^{k-2, r_{k-2}, k-2} \cdots 2, r_{2, 2} \Rightarrow b(1, 2)
\]

\[\vdots
\]

\[\Rightarrow b^{k-1, r_{k-1}, k-1}(1, k - 1)
\]

\[\Rightarrow b(k + 1) \Rightarrow b^{k+2, r_{k+2}, k+2} \cdots n-1, r_{n-1}, n-1 \Rightarrow b(k, n - 1) \Rightarrow b^{0, r_{0}, n}(b, n)
\]

\[\Rightarrow b(k - 1, k + 1) \Rightarrow b^{k+2, r_{k+2}, k+2} \cdots n-1, r_{n-1}, n-1 \Rightarrow b(k - 1, n - 1)
\]

\[\vdots
\]

\[\Rightarrow b^{k+1, r_{k+1}, k+1}(1, k + 1) \Rightarrow b^{k+2, r_{k+2}, k+2} \cdots k, r_{1, k} \Rightarrow b(1, k') = b.
\]

If $k = k'$, the last line is $b^{k+1, r_{k+1}, k+1}(2, k + 1) = b$. For convenience we put $r_{1, k} = 0$.

With these $r_{j, i}$ we get

\[(6.3.8) \quad \tilde{j}^{(b)}(b) = \tilde{e}_1^{r_{1, k-1}} \tilde{e}_2^{r_{2, k-2}} \cdots \tilde{e}_k^{r_{k-2}} \tilde{e}_{k-1}^{r_{k-1}}
\]

\[\tilde{e}_1^{r_{2, k-2}} \tilde{e}_2^{r_{2, k-2}} \cdots \tilde{e}_{k-2}^{r_{k-2}}
\]

\[\vdots
\]

\[\tilde{e}_1^{r_{1, k-1}}
\]

\[\tilde{e}_n^{r_{n, k+1}} \tilde{e}_{n-1}^{r_{n-1, k+1}} \tilde{e}_{n-2}^{r_{n-2, k+2}} \cdots \tilde{e}_{k+2}^{r_{k+2}}
\]

\[\vdots
\]

\[\tilde{e}_n^{r_{1, k+1}} \tilde{e}_{k+1}^{r_{1, k+1}} \cdots \tilde{e}_{2k}^{r_{1, k+1}}(b).
\]

If $k = k'$, the last line is $\tilde{e}_n^{r_{n, k+1}} \tilde{j}^{(b)}(b)$. Note that in the first half of (6.3.8) the $\tilde{e}_i$'s are with $i \in \{1, \ldots, k - 1\}$, and in the latter half $\tilde{e}_i$'s are with $i \in \{k + 1, \ldots, n\}$. Hence they commute each other. Furthermore, $\tilde{e}_{k-1}$ in the first row commutes with all the $\tilde{e}_i$'s in the second and subsequent rows except for the $\tilde{e}_{k-2}$ in the second row, and this $\tilde{e}_{k-2}$ commutes with all the $\tilde{e}_i$'s in the third and subsequent rows except for the
\( \tilde{e}_{k-1} \) in the third row, and so on. Therefore, we can write

\[
(6.3.9) \quad \tilde{j}^{(k)}(b) = (a \text{ sequence of } \tilde{e}_1, \ldots, \tilde{e}_{k-2}, \tilde{e}_{k+2}, \ldots, \tilde{e}_n) \tilde{b}''
\]

\[
(6.3.10) \quad \tilde{b}'' = \tilde{e}_{k-1}^{r_{1,i}} \tilde{e}_{k-2}^{r_{1,i}} \cdots \tilde{e}_1^{r_{1,i}} \tilde{e}_{k+1}^{r_{k,i}} \tilde{e}_{k+2}^{r_{1,i}} \cdots \tilde{e}_n^{r_{1,i}} \tilde{t}^{(k)}(b) \quad \text{if } k < k'
\]

\[
= \tilde{e}_{k-1}^{r_{1,i}} \tilde{e}_{k-2}^{r_{1,i}} \cdots \tilde{e}_1^{r_{1,i}} \tilde{e}_{k+1}^{r_{1,i}} \tilde{e}_{k+2}^{r_{1,i}} \cdots \tilde{e}_n^{r_{1,i}} \tilde{j}^{(k)}(b) \quad \text{if } k = k'.
\]

In (6.3.9) neither \( \tilde{e}_{k-1} \) nor \( \tilde{e}_{k+1} \) appears. Hence, if we set \( (x_{j,i}''') = x(b'', \) then we have \( x_{j,k} = x_{j,k}', \) and \( x_{j,k+1} = x_{j,k+1}'''. \) Proposition 6.2.2 implies that \( r_{1,j} \geq r_{1,j+1} \) and \( r_{k+1-j,n+1-j} \geq r_{k+1-j,n+1-j}. \) Therefore, from (6.3.6) and (6.3.10) we get \( x_{j,k}' \) and \( x_{j,k+1}' \) as above.

**Proof of Theorem 1.2.3.** Let \( l_{j,i} = \sum_{j \leq i \leq k} x_{j,i}. \) Consider the following statement for \( 1 \leq i \leq k - 1. \)

\( (A)_j \quad p_{l+1-j,i} \geq 0 \quad (j + 1 \leq i \leq k), \)

\( p_{k+1-j,i} \geq 0 \quad (k + 1 \leq i \leq n - j). \)

\( (B)_j \quad x_{j+1,i} = x_{j,i} \quad (j + 1 \leq i \leq k), \)

\( x_{k+1-j,i} = x_{k-j,i} \quad (k + 1 \leq i \leq n - j). \)

\( (C)_j \quad p_{l+1} \geq 0. \)

\( (D)_j \quad p_{l+1} \leq 0. \)

\( (E)_j \quad r_{l+1-j,i} = l_{l+1-j,i} - l_{k+1-j} \quad (j \leq i \leq k - 1), \)

\( r_{k+1-j,i} = l_{k+1-j,i} - l_{k+1-j} \quad (k + 1 \leq i \leq n + 1 - j). \)

\( (F)_j \quad r_{l,j} = l_{l,j} - l_{k+1-j} \)

\( r_{k+1-j,n+1-j} = l_{k+1-j,n+1-j} - l_{k+1-j}. \)

From Proposition 6.3.3 and 6.3.4, the equality \( \sum_{l=0}^{n} e_l(b) = l \) holds if and only if the following \( (A)_j \) and \( (D)_j \) hold. We will show the equivalence of the following.

(i) \( (A)_j, \) and \( (D)_j \) \( 1 \leq j \leq k - 1. \)

(ii) \( (B)_j \) \( 1 \leq j \leq k - 1. \)

Note that (ii) implies Theorem 1.2.3.

First, we show that \( (A)_j (1 \leq j \leq j_0) \) implies \( (E)_j. \) Let us trace (6.3.7), the process of the standard tableau \( b \) changing to \( b', \) more closely under the condition \( (A)_j \) \( (1 \leq j \leq j_0). \) Note that at each \( r_{j,i} \) step \( \Rightarrow \) the standard tableau changes some nodes from \( i \) to \( i + 1. \) We claim the following.
(6.3.11) Assume \((A)_j\) \((1 \leq j \leq j_0)\). Then for \(1 \leq j \leq j_0\), the changes for \(i, r_{i+1-j, i} \Rightarrow (j \leq i \leq k - 1)\) take place on the \((i + 1 - j)\)th row, and the changes for \((k + 1 \leq i \leq n - j)\) take place on the \((k + 1 - j)\)th row. Furthermore, \((E)_j\) and \((F)_{j+1}\) are valid.

Let us prove this by induction on \(j_0\). Since \(f_i^j\) in the process from \(b\) to \(b(1, k - 1)\) and those from \(b(1, k - 1)\) to \(b\) commute, it is enough to prove the two cases separately. Since the proofs for them are similar, we give it for the first half.

First, consider the case \(j_0 = 1\). Since \(p_{k-1, k-1} \geq 0\), we have \(p_{k-1, k-1} = x_{k-1, k-1} - x_{k-1, k-1} \leq 0\). Therefore, we have \(\psi_{k-1}(b) = (-p_{k+1, k-1}) = (-p_{k, k-1}) = x_{k-1, k-1} - x_{k, k} = l_{k-1, k-1} - l_k\). This implies that the changes for \(i, r_{i+1-j, j} \Rightarrow (j \leq i \leq k - 1)\) are on the \((k - 1)\)th row. Hence, by the definition of \(p_{j, i}\), \(p_{k-2, k-2}\) of \(b(k - 1, k - 1)\) is equal to that of \(b\). Therefore, noting that \(l_{k-1, k-1}\) for \(b(k - 1, k - 1)\) has changed to \(l_k\), we have \(\psi_{k-2}(b(k - 1, k - 1)) = (-p_{k+1, k-2}) = (-p_{k-1, k-2}) = l_{k-2, k-2} - l_k\).

By continuing this we can prove that changes for \(i, r_{i+1-j, j} \Rightarrow (1 \leq i \leq k - 1)\) take place only on the \(i\)th row. Therefore, the first half of \((E)_j\) follows. Furthermore, it turns out that for \(b(1, 1)\) and after, the change from 2 to 3 is possible only on the first row. This proves \((F)_2\).

Now let us proceed the induction step to \(j_0 = 2\). Define \(b(2)\) by

\[
b(1, 1) \Rightarrow \cdots \Rightarrow \Rightarrow \Rightarrow b(2).
\]

Compare \(b(2)\) with \(b\). Among \(l_{i, i}\), those which have changed their values are \(l_{k, k}\) \((1 \leq i \leq k - 1)\) and \(l_{k, i}\) \((k + 1 \leq i \leq n)\). For \(b(2)\) we have \(l_{k, i} = l_k\) \((1 \leq i \leq k - 1)\) and \(l_{k, i} = l_k\) \((k + 1 \leq i \leq n)\). Moreover, \(p_{j, i}\) appearing in \((A)_j\) \((2 \leq j \leq k - 1)\) have not changed. Therefore, the same structure of the proof remains for the next step. By repeating this we can prove the assertion.

Now we go back to the equivalence of (i) and (ii).

Let us prove (ii) \(\Rightarrow\) (i). From \((B)_j\) \((1 \leq j \leq k - 1)\) it is easy to see \((A)_j\) \((1 \leq j \leq k - 1)\). Therefore, we have \((E)_j\). Note that the convention \(r_{1, k} = 0\) is consistent with \((E)_k\) with \(i = k\). Substituting all these to (6.3.11) we have

\[
x'_{j, k} = l_{1, j+1} - l_{1, j} = x_{1, j+1},
\]

\[
x'_{j+1, k+1} = l_{k+1-n, j+1} - l_{1, j+1} = x_{k+1-n, j+1} - l_{k, j+1} - l_{k-j},
\]

for \(1 \leq j \leq k - 1\). Note that from \((B)_j\) we have \(l_{k, j} = l_{k+1-j, j} = x_{k, j-k} + x_{k-j, k-j} - x_{k+1-j, k+1-j}\) and \(l_{k, k} - l_{k+1-j, j} = x_{k, j-k} - x_{k+1-j, k+1-j}\). Therefore, we have \(x'_{j+1, k+1} = x_{k, j-k} = x_{1, j+1}\). Hence we obtain \((D)_j\) for \(1 \leq j \leq k - 1\).

Let us prove (i) \(\Rightarrow\) (ii). We assume (i). Note that \((C)_0\) is valid. Assume \((A)_j\) for \(1 \leq j' \leq j\) and \((C)_{j-1}\). From \((A)_j\) we have

\[
0 \leq \sum_{i=2}^{k+1-j} p_{i, i+j-1} \leq x_{k+1-j, k+1} - x_{1, j+1},
\]
\[ 0 \leq \sum_{i=k+1}^{n-j} p_{k+1-j,i} \leq \sum_{i=k+1}^{n-j} (x_{k+1-j,i+1} - x_{k-j,i}). \]

Therefore, we have

\[ x_{k+1-j,k+1} - x_{1,j-1} + \sum_{i=k+1}^{n-j} (x_{k+1-j,i+1} - x_{k-j,i}) \geq 0. \]

From (C)_{j-1} and (D), we have \( x'_{j,k} - x'_{j+1,k+1} \geq 0 \). Therefore, by using Proposition 6.3.7, we have

\[
0 \leq x'_{j,k} - x'_{j+1,k+1} = l_{k-j} - l_{k+1-j} - r_{1,j} + r_{1,j+1} - r_{k+1-j,n+1-j} + r_{n-j,n-j}.
\]

From (6.3.11) we have (F)_{j} and (F)_{j+1}. Therefore, we have

\[ x_{k+1-j,k+1} - x_{1,j-1} + \sum_{i=k+1}^{n-j} (x_{k+1-j,i+1} - x_{k-j,i}) \leq 0. \]

Comparing (6.3.12–6.3.15), we have (B)_{j} and \( p'_{j+1} = 0 \) (in particular, (C)_{j}). From (B)_{j} and (A)_{j} follows (A)_{j+1}. Thus by induction we have proved (ii). \( \square \)

Suppose that \( b \in B^{k+1} \) is minimal and set \( (x_{j,i}) = x(b) \). Set \( a_{i} = x_{i,i} (1 \leq i \leq k) \) and \( b_{i} = x_{1,i} (2 \leq i \leq k') \). Let \( \Lambda = \sum_{i=0}^{n} \lambda_{i} \Lambda_{i} \) be a dominant integral weight of level \( l \), i.e., \( \lambda_{i} \in \mathbb{Z}_{\geq 0}, \sum_{i=0}^{n} \lambda_{i} = l \). We claim that there exists a unique \( b \) such that \( e_{i}(b) = \lambda_{i} \).

**Proposition 6.3.8.** With the notation as above, the equalities \( e_{i}(b) = \lambda_{i} (0 \leq i \leq n) \) hold if and only if

\[
\lambda_{i} = a_{k} \quad i = 0
\]

\[
= b_{i+1} \quad 1 \leq i \leq k'-1
\]

\[
= a_{i+1-k'} - a_{i+2-k'} \quad k' \leq i \leq n.
\]

**Proof.** The assertion follows from Proposition 6.3.2 and Proposition 1.2.3. \( \square \)

**Proposition 6.3.9.** Let \( \Lambda \) and \( b \) be given as above. Set \( \Lambda' = \Lambda + \text{wt } b \). Then we have

\[
\lambda'_{i} = \lambda_{i+k'-1} \quad (0 \leq i \leq k - 1)
\]

\[
= \lambda_{i-k} \quad (k \leq i \leq n),
\]

where \( \Lambda' = \sum_{i=0}^{n} \lambda'_{i} \Lambda_{i} \).
Proof. Set \( m_i = \# \{(j, j')|m_{j,j'} = i\} \) where \( (m_{j,j'}) = m(b) \). We have \( \lambda'_i = \lambda_i + m_i - m_{i+1} \). If \( k \leq k' - 1 \), then we have

\[
m_i - m_{i+1} = b_k - a_k \quad (i = 0)
\]
\[
= a_i - a_{i+1} - b_{i+1} \quad (1 \leq i \leq k - 1)
\]
\[
= a_k - b_{i+1} \quad (i = k)
\]
\[
= b_{i+1 - k} - b_{i+1} \quad (k + 1 \leq i \leq k' - 1)
\]
\[
= b_{i+1 - k} + a_{i+2 - k'} - a_{i+1 - k'} \quad (k' \leq i \leq n).
\]

If \( k \geq k' \), then we have

\[
m_i - m_{i+1} = b_k - a_k \quad (i = 0)
\]
\[
= a_i - a_{i+1} - b_{i+1} \quad (1 \leq i \leq k' - 1)
\]
\[
= a_i - a_{i+1} + a_{i+2 - k'} - a_{i+1 - k'} \quad (k' \leq i \leq k - 1)
\]
\[
= a_k + a_{i+2 - k'} - a_{i+1 - k'} \quad (i = k)
\]
\[
= b_{i+1 - k} + a_{i+2 - k'} - a_{i+1 - k'} \quad (k + 1 \leq i \leq n).
\]

The assertion then follows from Proposition 6.3.8. \( \square \)

Proposition 6.3.10. \( B^{k,l} \otimes B^{k,l} \) is connected.

Proof. Let \( u_0 \in B^{k,l} \) be the highest-weight element of \( i^{(0) *} (B^{k,l}) \) and \( v_0 \in B^{k,l} \) be the lowest-weight element of \( i^{(k) *} (B^{k,l}) \). For any \( b_1 \otimes b_2 \in B^{k,l} \otimes B^{k,l} \), we shall show that \( b_1 \otimes b_2 \) is connected to \( u_0 \otimes v_0 \). By the description of the actions of \( \tilde{f}_i \) in [KN], we can easily obtain that \( \tilde{f}_i u_0 = 0 \) for \( i = 1, \ldots, k - 1, k + 1, \ldots, n \). Assuming that \( \tilde{f}_0 u_0 \neq 0 \), we have \( \text{wt} i^{(0) *} (\tilde{f}_0 u_0) = l \Lambda_k + \alpha_1 + \cdots + \alpha_n \) by \( \alpha_0 = -\sum_{i=1}^n \alpha_i \) in the sense of classical weight. This is a contradiction to the fact that \( u_0 \) is the highest element of \( i^{(0) *} (B^{k,l}) \cong B(l \Lambda_k) \). Then \( \tilde{f}_0 u_0 = 0 \). Therefore, we have \( \varphi_j(u_0) = 0 \) for \( j \neq k \). Let \( u_0 \otimes b \) be the highest-weight element of the connected component of \( i^{(0) *} (B^{k,l} \otimes B^{k,l}) \) that contains \( b_1 \otimes b_2 \); hence \( b_1 \otimes b_2 \) is connected to \( u_0 \otimes b \) by \( \tilde{f}_1, \ldots, \tilde{f}_n \). \( b \) can be written in the following form: \( b = \tilde{e}_{i_1} \cdots \tilde{e}_{i_j} v_0 \) \((i_j \neq k)\). By \( \varphi_j(u_0) = 0 \) \((j \neq k)\), if \( j \neq k \), then \( \tilde{f}_j(u_0 \otimes b) = u_0 \otimes \tilde{f}_j b \). Hence, \( \tilde{f}_{i_1} \cdots \tilde{f}_{i_j} (u_0 \otimes b) = u_0 \otimes v_0 \). \( \square \)

Now, we have completed the proof of the Theorem 1.2.2 by Theorem 1.2.3, Proposition 6.3.10, Corollary 6.3.6, and Remark 1.2.4.
The following will not be used in the rest of the paper, and the proof is omitted. Let \( c = (c_0, c_1, \ldots, c_k) \) and \( c^* = (c^*_2, \ldots, c^*_k) \) be a partition of \( \{1, \ldots, n+1\} \) such that \( 1 = c_0 < c_1 < \cdots < c_k = n + 1 \) and \( c^*_2 < \cdots < c^*_k \). For \( c, c' \) we denote \( c \leq c' \) if and only if \( c_j \leq c'_j (\forall j) \). Define

\[
\Delta(c, b) = \sum_{j=2}^{k+1} x_{j+1-1} x_j^*,
\]

\[
B(c) = \{ b \in B | \Delta(c, b) \leq \Delta(c', b) \text{ if } c' \leq c, \Delta(c, b) < \Delta(c', b) \text{ otherwise} \},
\]

\[
F(c)_{j,i} = 1 \quad \text{if } i = c_{j-1},
\]

\[
= -1 \quad \text{if } i = c_j,
\]

\[
= 0 \quad \text{otherwise}.
\]

**Proposition 6.3.11.** With the notation as above, we have the following.

1. \( B = \bigsqcup_{c} B(c) \) is a disjoint union.
2. If \( b \in B(c) \), then \( \tilde{f}_0 b = 0 \) if and only if
   \[
   c = (1, k, k + 1, \ldots, n + 1) \quad \text{and} \quad x_{1,k'} = 0.
   \]
3. Suppose that \( \tilde{f}_0 b \neq 0 \). Then we have \( y_{j,i} = x_{j,i} + F(c)_{j,i} \) where \( (y_{j,i}) = x(\tilde{f}_0 b) \).

**6.4. \( (C_n^{(1)}, B(\Lambda_n)) (n \geq 2) \).** We shall use the notation in 1.3.

**Lemma 6.4.1.** We have

\[
\omega_{j,i} = x_{j,i+1} + x_{j^*,i} - x_{j-i,i} - x_{j^{*1},i+1} \quad \text{if } 1 \leq j < i < n
\]

\[
= x_{j,n} - x_{j-1,n} \quad \text{if } 1 \leq j \leq i = n.
\]

The proof is immediate. From this we have the following proposition.

**Proposition 6.4.2.** For \( b \in B \) we have

\[
\epsilon_i(b) = \sum_{j=1}^{i} (p_{j,i})_+
\]

where \( p_{j,i} (0 \leq j \leq i \leq n) \) are defined inductively by

\[
p_{0,i} = 0,
\]

\[
p_{j,i} = \omega_{j,i} - (p_{j-1,i})_+ \quad (1 \leq j \leq i \leq n).
\]

Then we have another proposition.
PROPOSITION 6.4.3. For \( b \in B \) we have

\[
\sum_{i=1}^{n} e_i(b) \geq l - l_n.
\]

The equality holds if and only if \( p_{i,i} \geq 0 \) \( (2 \leq i \leq n) \).

\textbf{Proof.} Recall the proof of Proposition 6.3.3. Similarly, we have \( e_i(b) \geq \sum_{j=1}^{i} \omega_{j,i} \), where the equality holds if and only if \( p_{i,i} \geq 0 \) \( (2 \leq i \leq n) \). The right-hand side then reduces to \( l - l_n \). \( \square \)

\textbf{Proof of Proposition 1.3.1.} The existence is given in Section 5. Let us prove the uniqueness. Let \( J' = \{1, \ldots, n-1\} \) be the index set of the simple roots for \( \widehat{\mathfrak{sl}(n)} \), and let \( i^{(0,n)} : J' \to I \) be \( i^{(0,n)}(j) = j \). Set \( B' = i^{(0,n)^*}(B^n) \).

PROPOSITION 6.4.4. As a crystal of \( U_q(\widehat{\mathfrak{sl}(n)}) \), \( B' \) splits as

\[ B' = \bigoplus_{0 \leq l_0 < \cdots < l_n \leq l} B(\Lambda_{l_0, \ldots, l_n}) \]

where

\[ \Lambda_{l_0, \ldots, l_n} = (l - 2l_0)\Lambda_0 + \sum_{i=1}^{n-1} 2(l_i - l_{i+1})\Lambda_i + (2l_n - l)\Lambda_n. \]

If \( B_1 \) and \( B_2 \) are both isomorphic to \( B' \), then the isomorphism \( B_1 \to B_2 \) is unique.

We omit the proof of Proposition 6.4.4 which is similar to that of Proposition 6.3.1. From this follows the uniqueness of \( B^n \) similarly to the proof of Proposition 1.2.1. (see 6.3.) \( \square \)

\textbf{Proof of Theorem 1.3.2.} Set \( (x'_{ik}) = x(i^*(b)). \) Similarly, we define \( y'_{ik}, z'_{ik}, \) and so on.

PROPOSITION 6.4.5. For \( b \in B^n \) we have

\[ e_0(b) \geq l_n. \]

The equality holds if and only if \( p'_j \leq 0 \) \( (2 \leq j \leq n) \) where \( p'_j \) are defined inductively by

\[ p'_0 = 0, \quad p'_j = z'_{j-1,j} - z'_{i,j-1} - (p'_{j-1}). \]

In particular, we have \( p'_1 = l - l'_1 \geq 0 \).

\textbf{Proof.} By an argument similar to that which was used in the proof of Proposition 6.3.5, we have \( l'_i = l - l_{n+1-i} \). Therefore, we have

\[ e_0(b) = e_0(i^*(b)) = \sum_{j=1}^{n} (p'_j)_+ \geq l - l'_1 = l_n. \] \( \square \)
COROLLARY 6.4.6. For \( b \in B_{n,l} \), we obtain \( \langle c, \varepsilon(b) \rangle = \sum_{i=0}^{n} \varepsilon_i(b) \geq l \).

Proof of Theorem 1.3.3. Let \( b \) be an element in \( B_{n,l} \) such that \( \langle c, \varepsilon(b) \rangle = l \) and \( b \) be the unique element in \( B_{n,l} \) such that \( i(n, l)^{r_1, l} \) is the lowest element in the connected component of \( B' \) that contains \( i(n, l)^{r_1, l} \). This is obtained by

\[
\begin{align*}
i^{r_1, l}(b)^{n-1, r_{n-1}} &\Rightarrow b(1, n-1)^{n-2, r_{n-2}} \cdots \Rightarrow b(1, 2)^{1, r_{1,1}} \Rightarrow b(1, 1) \\
&\Rightarrow b(2, n-1)^{n-2, r_{n-2}} \cdots \Rightarrow b(2, 2) \\
&\vdots \\
&\Rightarrow b(n-1, n-1)^{n-2, r_{n-2}} \cdots \Rightarrow i^{r_1, l}(b).
\end{align*}
\]

Here \( r_{j, i} \) are determined in such a way that for each pair \( b_1, i \Rightarrow b_2 \) we have \( i^{r_1, l}(b) = 0 \). By Proposition 6.2.2 we have \( r_j < r_{j+1} \) (1 \( \leq j \leq n-2 \)) where \( r_j = r_{n-j, n-j} \). With these \( r_j \) set \( b'' = \xi_{n-1}^{r_{n-1}} \cdots \xi_1^{r_1} b \). Then we have \( x_{j, n}^r = x_{j, n}^\prime \) and \( x_{j, n+1}^r = x_{j, n+1}^\prime \) where \( (x_{j, i}) = x(t^{r_1}(b)) \). In this way we have

\[
z_{j, j+1} = 2l_{j+1} + r_{n-j} - r_{n-j-1} \quad (1 \leq j \leq n - 1).
\]

Here we set \( r_0 = 0 \).

From Proposition 6.4.3 and 6.4.5, the equality \( \sum_{i=0}^{n} \varepsilon_i(b) = l \) holds if and only if the following \( (A)_j \) and \( (D)_j \) (1 \( \leq j \leq n - 1 \)). Consider the following statements.

\[
\begin{align*}
(A)_j & \quad p_{i+1, i-j,i} \geq 0 \quad (j + 1 \leq i \leq n), \\
(B)_j & \quad \omega_{i+1, i-j,i} = 0 \quad (j + 1 \leq i \leq n), \\
(C)_j & \quad p_{j+1}^{r_j} = 0, \\
(D)_j & \quad p_{j+1}^{r_j} \geq 0, \\
(E)_j & \quad r_{n-j} = z_{1, n-j} - 2l_{n-j}.
\end{align*}
\]

We will show the equivalence of

(i) \( (B)_j \) \quad (1 \leq j \leq n - 1).

(ii) \( (A)_j \) and \( (D)_j \) \quad (1 \leq j \leq n - 1).

Note that (i) implies Theorem 1.3.3. Let us derive (i) from (ii). Assume that \( (A)_j \), \( (B)_j \), \( (C)_j \) are valid. From (A) we have \( \omega_{i+1, i-j,i} \geq 0 \). Therefore, we have

\[
\sum_{i=1}^{n} \omega_{i+1, i-j,i} = z_{1, n+1-j} - z_{1, n-j} + l_{n-j} - l_{n+1-j} \geq 0.
\]
Note that \((E)_0\): \(r_{n-1} = z_{1,n} - 2l_n\) holds in any case, and noting that the changes for \(r_i\) take place on the first row, we have that \((A)_1, \ldots, (A)_j\) imply \((E)_1, \ldots, (E)_j\). From \((C)_{j-1}\) and \((D)_j\) we get

\[
(p'_j)_{j+1} = z'_{j+1,j} - z_{j+1,j} = l'_{j+1} - l'_{j} + r_{n-j} - r_{n-j-1} \geq 0.
\]

Then by using \((E)_{j-1}\), \((E)_j\) and \(l'_j + l_{n+1-j} = l\), we get

\[
(p'_j)_{j+1} = z_{1,n+1-j} - z_{1,n-j} + l_{n-j} - l_{n+1-j} \geq 0.
\]

From (6.4.1) and (6.4.2) we have \((B)_j\) and \((C)_j\). From \((B)_j\) and \((A)_j\), we have \((A)_{j+1}\). Thus we proved (i) by assuming (ii).

Next, we show that (i) implies (ii). Note that (i) means \(\omega_{j,i} = 0\) \((1 \leq j \leq i \leq n)\).

Note also that \(p_{1,i} \geq 0\) \((1 \leq i \leq n)\). From these we can inductively show \(p_{j,i} = 0\) \((2 \leq j \leq i \leq n)\). In particular, we have \((A)_j\) \((1 \leq j \leq n-1)\). As we noted before, \((A)_1, \ldots, (A)_j\) imply \((E)_1, \ldots, (E)_j\). Therefore, we have \((p'_{j+1} = z_{1,n+1-j} - z_{1,n-j} + l_{n-j} - l_{n+1-j} \geq 0). Since \(\omega_{j,i} = 0\) \((2 \leq j \leq i \leq n)\), \(p'_{j+1} = 0\). Hence, we obtain \((C)_j\) and then \((D)_j\).

\[\square\]

**Proposition 6.4.7.** \(B^{n,l} \otimes B^{n,l}\) is connected.

The proof is similar to that of Proposition 6.3.10.

Now we completed the proof of Theorem 1.3.2 by Theorem 1.3.3, Proposition 6.4.7, Corollary 6.4.6, and Remark 1.3.4.

**6.5 \((D)_{n+1}^{(2)}, B(l\Lambda_n)\) \((n \geq 2)\).** We shall use the notation in 1.4. We describe the actions of \(\tilde{e}_i\) and \(\tilde{f}_i\) on \((m_{j,j'})\) as follows. First, we read each column of \((m_{j,j'})\) from the right to the left and obtain the sequence \(u_1 \cdots u_n\), where \(u_k\) is the \(k\)th column from the right.

1. **The case** \(i \neq n\). If there are \(i\) and \(\tilde{i} + 1\) in \(u_k\), then we identify it with \(+;\) if there are \(i + 1\) and \(\tilde{i}\) in \(u_k\), then we identify it with \(-;\) and otherwise, we identify it with 0. Then we obtain the actions of \(\tilde{e}_i\) and \(\tilde{f}_i\) \((1 \leq i < n)\).

2. **The case** \(i = n\). If there are \(n\) in \(u_k\), then we identify it with \(+;\) if there are \(\tilde{n}\) in \(u_k\), then we identify it with \(-;\) and otherwise, we identify it with 0. Then we obtain the actions of \(\tilde{e}_1\) and \(\tilde{f}_i\).

We also use

\[
l_j = y_{j,n} \quad (1 \leq j \leq n),
\]

\[
\omega_{j,i} = \begin{cases} 
  x_{j,i+1} - x_{j-1,i} & (1 \leq j \leq i < n), \\
  x_{j,n} - x_{j-1,n} & (1 \leq j \leq i = n).
\end{cases}
\]

Note that \(\omega_{1,i} = x_{1,i+1} - x_{0,i} = x_{1,i+1} \geq 0\).

**Proposition 6.5.1.** For \(b \in B\) we have

\[
\varepsilon_i(b) = \sum_{j=1}^{i} (p_{j,i})_+
\]
where \( p_{j,i}(0 \leq j \leq i \leq n) \) are defined inductively by
\[
p_{0,i} = 0,
\]
\[
p_{j,i} = \omega_{j,i} - (p_{j-1,i})_+ \quad (1 \leq j \leq i \leq n).
\]
Then we have the following proposition.

**PROPOSITION 6.5.2** For \( b \in B \) we have
\[
2 \sum_{i=1}^{n-1} e_i(b) + e_n(b) \geq l - l_n.
\]
The equality holds if and only if \( p_{i,i} \geq 0 \) (\( 2 \leq i \leq n \))

**Proof.** Recall the proof of Proposition 6.3.3. Similarly, we have \( e_i(b) \geq \sum_{j=1}^i \omega_{j,i} \), where the equality holds if and only if \( p_{i,i} \geq 0 \) (\( 2 \leq i \leq n \)). The right-hand side then reduces to \( l - l_n \).

**Proof of Proposition 1.4.1.** The existence is given in Section 5. Let us prove the uniqueness. Let \( J' = \{1, \ldots, n - 1\} \) be the index set of the simple roots for \( \mathfrak{sl}(n) \), and let \( t^{(0,n)} : J' \to I \) be \( t^{(0,n)}(j) = j \). Set \( B' = t^{(0,n)}(B^{n,l}) \).

**PROPOSITION 6.5.3.** As a crystal of \( U_q(\mathfrak{sl}(n)) \), \( B' \) splits as
\[
B' = \bigoplus_{0 \leq l_1 \leq \cdots \leq l_n = l} B(\Lambda_{l_1,\ldots,l_n})
\]
where
\[
\Lambda_{l_1,\ldots,l_n} = \sum_{i=0}^{n-1} (l_i - l_{i+1}) \Lambda_i.
\]
If \( B_1 \) and \( B_2 \) are both isomorphic to \( B' \), then the isomorphism \( B_1 \to B_2 \) is unique.

We omit the proof of the Proposition 6.5.3 which is similar to that of Proposition 6.3.1. From this follows the uniqueness of \( B^{n,l} \) similarly to the proof of Proposition 1.2.1. (see 6.3.)

Now we are going to prove Theorem 1.4.2. Set \( x_{j,k}^i = x(i^*(b)) \). Similarly, we define \( x_{j,k}' \), \( y_{j,k}' \), and so on.

**PROPOSITION 6.5.4.** For \( b \in B^{n,l} \) we have
\[
e_0(b) \geq l_n.
\]
The equality holds if and only if \( p_j^i \leq 0 \) (\( 2 \leq j \leq n \)) where \( p_j^i \) are defined inductively by
\[
p_0^0 = 0, \quad p_j^i = x_{j,k}^i - x_{j-1,n}^i - (p_{j-1,i})_+.
\]
In particular, we have \( p_1^i = l - l_1' \geq 0 \).
Proof. By an argument similar to that which was used in the proof of Proposition 6.3.5, we have \( l'_1 = l - l_{n+1-i} \). Therefore, we have

\[
e_0(b) = e_n(i^*(b)) = \sum_{j=1}^{n} (p'_i)_j \geq l - l'_1 = l_n. \]

\[
\Box
\]

**Corollary 6.5.5.** For \( b \in B^{n,l} \), we have

\[
\langle c, e(b) \rangle = e_0(b) + 2 \sum_{i=1}^{n-1} e_i(b) + e_n(b) \geq 1.
\]

**Proof of Theorem 1.4.3.** Let \( b \) be an element in \( B^{n,l} \) such that \( \langle c, e(b) \rangle = l \) and \( b \) be the unique element in \( B^{n,l} \) such that \( i^{(0,n)*}(b) \) is the lowest element in the connected component of \( B' \) that contains \( i^{(0,n)*}(b) \). This is obtained by

\[
i^{(0)*}(b) \\
n^{-1,r_{n-2},r_2,n-2} \Rightarrow b(1, n-1) \\
n^{-2,r_{n-2},r_2,n-2} \Rightarrow b(1, 2) \\
n^{-2,r_{n-2},r_2,n-2} \Rightarrow b(2, n-1) \\
n^{-2,r_{n-2},r_2,n-2} \Rightarrow b(2, 2) \\
\vdots \\
n^{-2,r_{n-2},r_2,n-2} \Rightarrow b(n-1, n-1) = i^{(0)*}(b).
\]

Here \( r_{j,i} \) are determined in such a way that for each pair \( b_1(i) \sim b_2 \) we have \( f_{i} b_2 = 0 \). By Proposition 6.2.2 we have \( r_j < r_{j+1} (1 \leq j \leq n-2) \) where \( r_j = r_{n-j,n-j} \). With these \( r_j \), set \( b'' = e_n^{r_{n-1}} \cdots e_1^{r_1} b \). Then we have \( x'_{j,n} = x_{j,n} \) and \( x'_{j,n+1} = x_{j,n+1} \) where \( (x'_{j,i}) = x(i^*(b'')) \). In this way we have

\[
x_{j,1,n} = 2(r_{n-j} - r_{n-j-1}) - (y_{j,n} - y_{j+1,n}) \quad (1 \leq j \leq n-1).
\]

Here we set \( r_0 = 0 \).

From Proposition 6.5.2 and 6.5.4, the equality \( e_0(b) + 2 \sum_{i=1}^{n-1} e_i(b) + e_n(b) = l \) holds if and only if the following \((A)_j\) and \((D)_j\) \( (1 \leq j \leq n-1) \). Consider the following statements.

\[
(A)_j \quad p_{i+1-j,i} \geq 0 \quad (j + 1 \leq i \leq n),
\]

\[
(B)_j \quad \omega_{i+1-j,i} = 0 \quad (j + 1 \leq i \leq n),
\]

\[
(C)_j \quad p'_{j+1} = 0.
\]

\[
(D)_j \quad p'_{j+1} \leq 0,
\]

\[
(E)_j \quad r_{n-j-1} = y_{1,j+1} - y_{n-j,n} \quad (0 \leq j \leq n-1).
\]
We will show the equivalence of the following two statements:

(i) \((B)_j\) \hspace{1cm} (1 \leq j \leq n - 1),

(ii) \((A)_i\) and \((D)_j\) \hspace{1cm} (1 \leq j \leq n - 1).

Let us derive (i) from (ii). Assume that \((A)_1, \ldots, (A)_j\) and \((C)_{j-1}\) are valid. From \((A)_j\) we have \(\omega_{i+1-j,i} \geq 0\). Therefore, we have

\[
(6.5.2) \quad x_{n-j,n} \geq x_{n-j-1,n-1} \geq x_{n-j-2,n-2} \geq \cdots \geq x_{2,j+2} \geq x_{1,j+1},
\]

\[
(6.5.3) \quad x_{n-j+1,n} \geq x_{n-j,n} \text{ and then } 2y_{n-j,n-1} \geq y_{n-j+1,n} + y_{n-j,n}.
\]

Note that \((E)_0\): \(r_{n-1} = y_{1,1} - y_{n,n}\) holds in any case, and noting that the changes for \(r_{i,i}\) take place on the first row, we have \((A)_1, \ldots, (A)_j\) imply \((E)_1, \ldots, (E)_j\). From \((C)_{j-1}\) and \((D)_j\) we get

\[
(6.5.4) \quad p'_{j+1} = x'_{j+1,n} - x'_{j,n} \leq 0.
\]

Then by using \((E)_{j-1}\), \((E)_j\), \((6.5.1)\), \((6.5.4)\), and \(y_{j,n} + y_{n+1-j,n} = l\), we get

\[
(6.5.5) \quad p'_{j+1} = 2(y_{1,j} - y_{n-j+1,n} - y_{1,j+1} + y_{n-j,n}) - (y_{n-j,n} - y_{n+1-j,n})
\]

\[= 2(y_{1,j} - y_{1,j+1}) + (y_{n-j,n} - y_{n-j+1,n}) \leq 0.\]

From \((6.5.3)\) and \((6.5.5)\) we obtain \(y_{1,j+1} - y_{1,j} \geq y_{n-j,n} - y_{n-j,n-1}\) and then

\[
(6.5.6) \quad x_{1,j+1} \geq x_{n-j,n}.
\]

From \((6.5.2)\) and \((6.5.6)\),

\[
(6.5.7) \quad x_{1,j+1} = x_{2,j+2} = \cdots = x_{n-j,n}.
\]

Then we have \((B)_j\) and \((C)_j\). From \((B)_j\) and \((A)_j\), we have \((A)_{j+1}\). Thus we proved (i) by assuming (ii).

Next, we show that (i) implies (ii). Assume \((C)_{j-1}\). Note that (i) means \(\omega_{j,i} = 0\) \((1 \leq j < i \leq n)\) and \(p_{i,i} \geq 0\) \((1 \leq i \leq n)\). From these we can inductively show \(p_{j,i} = 0\) \((2 \leq j < i \leq n)\). In particular, we have \((A)_j\) \((1 \leq j \leq n-1)\). As we noted before, \((A)_1, \ldots, (A)_j\) imply \((E)_1, \ldots, (E)_j\). Therefore, we have

\[
(6.5.8) \quad p'_{j+1} = 2(y_{1,j} - y_{1,j+1}) + (y_{n-j,n} - y_{n-j+1,n}).
\]

From \((B)_j\), we have \(x_{n-j,n} = x_{1,j+1}\). Hence \(y_{n-j,n} - y_{n-j,n-1} = y_{1,j+1} - y_{1,j}\). From
this and (6.5.8), we obtain
\[
p_{i+1} = -2(y_{n-j,n} - y_{n-j,n-1}) + (y_{n-j,n} - y_{n-j+1,n})
= (y_{n-j,n-1} - y_{n-j,n}) + (y_{n-j,n-1} - y_{n-j+1,n})
= -x_{n-j,n} + x_{n-j+1,n} = \omega_{n-j+1,n} = 0.
\]

Hence, we obtain (C) and then (D).

**Proposition 6.5.6.** \(B^{n,1} \otimes B^{n,1}\) is connected.

The proof is similar to that of Proposition 6.3.10.

Now we have completed the proof of Theorem 1.4.2 by Theorem 1.4.3, Proposition 6.5.6, Corollary 6.5.5, and Remark 1.4.4.

6.6. \((D_n^{(1)}, B(\Lambda_{n-1})\) and \(B(\Lambda_n)\) \((n \geq 4)\). We shall use the notation in 1.5. We describe the actions of \(\tilde{e}_i\) and \(\tilde{f}_i\) on \((m_{j,j'})\) as follows. First, we read each column of \((m_{j,j'})\) from right to left and then obtain a sequence \(u_1, u_2, \ldots, u_k\) where \(u_k\) is the \(k\)th column from the right side. Then the actions of \(\tilde{e}_i\) and \(\tilde{f}_i\) on \(u_k\) are as follows.

1. The case \(i \neq n\).
   (i) If \(u_k\) contains \(i\) and \(i+1\), then \(\tilde{f}_i u_k\) is obtained by replacing \(i\) and \(i+1\) with \(i+1\) and \(i\) and otherwise, \(\tilde{f}_i u_k = 0\).
   (ii) If \(u_k\) contains \(i+1\) and \(i\), then \(\tilde{e}_i u_k\) is obtained by replacing \(i+1\) and \(i\) with \(i\) and \(i+1\) and otherwise, \(\tilde{e}_i u_k = 0\).

2. The case \(i = n\).
   (i) If \(u_k\) contains \(n-1\) and \(n\), then \(\tilde{f}_n u_k\) is obtained by replacing \(n-1\) and \(n\) with \(n\) and \(n-1\) and otherwise, \(\tilde{f}_n u_k = 0\).
   (ii) If \(u_k\) contains \(n\) and \(n-1\), then \(\tilde{e}_n u_k\) is obtained by replacing \(n\) and \(n-1\) with \(n-1\) and \(n\) and otherwise, \(\tilde{e}_n u_k = 0\).

From these descriptions, we obtain the actions of \(\tilde{e}_i\) and \(\tilde{f}_i\) in the following way.

(a) The case \(i \neq n\). If \(u_k\) contains \(i\) and \(i+1\), then \(u_k\) is identified with \(+\); if \(u_k\) contains \(i+1\) and \(i\), then \(u_k\) is identified with \(-\); and otherwise, \(u_k\) is identified with 0.

(b) The case \(i = n\). If \(u_k\) contains \(n-1\) and \(n\), then \(u_k\) is identified with \(+\); if \(u_k\) contains \(n\) and \(n-1\), then \(u_k\) is identified with \(-\); and otherwise, \(u_k\) is identified with 0.

For \(b \in B\) (resp. \(B'\)) we also use the notation
\[
\omega_{j,i} = x_{j,i+1} - x_{j-1,i} \quad (1 \leq j \leq i \leq n - 2).
\]
If \(n\) is even, for \(j = 2, \ldots, n\)
\[
\omega_{j,n-1} = \begin{cases} x_{j,n-1} - x_{j-3,n-1} & \text{if } j \text{ is odd (resp. even)}, \\ 0 & \text{if } j \text{ is even (resp. odd)} \end{cases}
\]
\[
\omega_{j,n} = \begin{cases} x_{j,n-1} - x_{j-3,n-1} & \text{if } j \text{ is even (resp. odd)}, \\ 0 & \text{if } j \text{ is odd (resp. even)} \end{cases}
\]
If $n$ is odd, for $j = 2, \ldots, n$

$$
\omega_{j,n-1} = \begin{cases} x_{j,n-1} - x_{j-3,n-1} & \text{if } j \text{ is even (resp. odd)}, \\ 0 & \text{if } j \text{ is odd (resp. even)} \end{cases}
$$

$$
\omega_{j,n} = \begin{cases} x_{j,n-1} - x_{j-3,n-1} & \text{if } j \text{ is odd (resp. even)}, \\ 0 & \text{if } j \text{ is even (resp. odd)} \end{cases}
$$

**Proposition 6.6.1.** For $b \in B$ we have

$$
\varepsilon_i(b) = \sum_{j=1}^i (p_{j,i})_+
$$

where $p_{j,i}$ are defined by inductively as follows; for $0 \leq j \leq i \leq n - 2$,

$$
p_{0,i} = 0,
$$

$$
p_{j,i} = \omega_{j,i} - (-p_{j-1,i})_+ \quad (1 \leq j \leq i \leq n - 2),
$$

for $0 \leq j \leq i = n - 1$ or $n$,

$$
p_{0,i} = p_{1,i} = 0,
$$

$$
p_{j,i} = \omega_{j,i} - (-p_{j-2,i})_+ \quad (1 \leq j \leq i = n - 1, n).
$$

**Lemma 6.6.2.** For $b \in B$ we have

$$
\varepsilon_1(b) + 2\varepsilon_2(b) + \cdots + 2\varepsilon_{n-2}(b) \geq \sum_{k=1}^{n-3} (|p_{k,k}| + 2y_{k,n-1} - 2y_{k,n-2}) + y_{n-2,n-1} - y_{n-2,n-2}.
$$

The equality holds if and only if $p_{i-1,i} \geq 0$ ($2 \leq i \leq n - 2$).

**Proof.** From the identities $x_+ - (-x)_+ = x$ and $|x| + x = 2(x)_+$, for $2 \leq i \leq n - 2$,

(6.6.1) \quad $(p_{1,i})_+ + \cdots + (p_{i-1,i})_+ + 2(p_{i,i})_+ = \omega_{1,i} + \cdots + \omega_{i,i} + |p_{i,i}|,$

(6.6.2) \quad $(p_{1,i})_+ + \cdots + (p_{i-1,i})_+ \geq \omega_{1,i} + \cdots + \omega_{i,i}.$

The equality of (6.6.2) holds if and only if $p_{i-1,i} \geq 0$. Hence, by the definitions of $\omega_{j,i},$ (6.6.1), and (6.6.2), we obtain the desired result. ☐
Lemma 6.6.3. For \( b \in B \) we have

\[ \varepsilon_{n-1}(b) + \varepsilon_n(b) \geq l + y_{n-2,n-2} - y_{n-2,n-1} - y_{n-1,n-1} + 2 \sum_{k=1}^{n-3} (y_{k,n-2} - y_{k,n-1}). \]

The equality of (6.6.3) holds if and only if \( p_{n-1,n-1} \geq 0 \) and \( p_{n,n} \geq 0 \).

Proof. From the identity \( x_+ - (-x)_+ = x \), we obtain

(i) If \( n \) is even,

\[ \varepsilon_{n-1}(b) \geq \omega_{1,n-1} + \omega_{3,n-1} + \cdots + \omega_{n-1,n-1}, \]

(ii) if \( n \) is odd,

\[ \varepsilon_{n-1}(b) \geq \omega_{2,n-1} + \omega_{4,n-1} + \cdots + \omega_{n-1,n-1}, \]

\[ \varepsilon_n(b) \geq \omega_{1,n} + \omega_{3,n} + \cdots + \omega_{n,n}. \]

The equalities of (6.6.4) and (6.6.5) hold if and only if \( p_{n-1,n-1} \geq 0 \) and \( p_{n,n} \geq 0 \). From (6.6.4), (6.6.5), and the definitions of \( \omega_{k,n-1} \) and \( \omega_{k,n} \), we obtain the desired result.

By Lemma 6.6.2 and Lemma 6.6.3, we obtain the following.

Proposition 6.6.4. For \( b \in B \) we have

(6.6.6)

\[ \varepsilon_1(b) + 2(\varepsilon_2(b) + \cdots + \varepsilon_{n-2}(b)) + \varepsilon_{n-1}(b) + \varepsilon_n(b) \geq l - y_{n-1,n-1} + \sum_{k=2}^{n-1} |p_{k,k}|. \]

The equality of (6.6.6) holds if and only if \( p_{k-1,k} \geq 0 \) (\( 2 \leq k \leq n - 2 \)), \( p_{n-1,n-1} \geq 0 \), and \( p_{n,n} \geq 0 \).

Proof of Proposition 1.5.1. The existence is given in Section 5. Let us prove the uniqueness. Let \( J' = \{1, 2, \ldots, n - 1\} \) be the index set of the simple roots for \( \mathfrak{sl}(n) \) and let \( t^{(0,n)}: J' \to I \) be \( t^{(0,n)}(j) = j \). Set \( \overline{B} = t^{(0,n)*}(B^{n,l}) \).

Proposition 6.6.5. As a crystal of \( U_q(\mathfrak{sl}(n)) \), \( \overline{B} \) splits as follows.

(i) If \( n \) is even,

\[ \overline{B} = \bigoplus_{0 \leq l_0 \leq l_2 \leq \cdots \leq l_0 = l} B(\Lambda_{l_2,l_4,\ldots,l_n}), \]

where \( l_k = y_{k,n} \) and \( \Lambda_{l_2,\ldots,l_n} = \sum_{k=0,2,4,\ldots,n} (l_k - l_{k+2}) \Lambda_k \).
(ii) If $n$ is odd,

$$
\tilde{B} = \bigoplus_{0 \leq l_n \leq l_{n-1} \leq \cdots \leq l_3 \leq l_1 = l} B(\Lambda_{l_1}, l_2, \ldots, l_n),
$$

where $l_k = y_{k,n}$ and $\Lambda_{l_1, l_2, \ldots, l_n} = \sum_{k=1, 3, \ldots, n} (l_k - l_{k+2}) \Lambda_k$.

If $B_1$ and $B_2$ are both isomorphic to $\tilde{B}$, then the isomorphism $B_1 \rightarrow B_2$ is unique.

We omit the proof of Proposition 6.6.5 which is similar to that of Proposition 6.3.1. From this, the uniqueness of $B^{n, l}$ follows similarly to the proof of Proposition 1.2.1. (see 6.3.).

Now we are going to prove Theorem 1.5.2. Set $(x^\vee_{j,k}) = x(i^\ast(b))$. Similarly, we define $y^\vee_{j,k}$, $\omega^\vee_{j,k}$ and so on.

**Proposition 6.6.6.** For $b \in B^{n, l}$ we have

$$
\varepsilon_0(b) \geq y_{n,n},
$$

where $p^\vee_{j,n}$ is defined by the same formulas as $p^\ast_{j,n}$ for $(x^\vee_{j,k})$. The equality of (6.6.7) holds if and only if $p^\vee_{j,n} \leq 0$ for $j = 3, \ldots, n$.

**Proof.** By a similar argument to that which was used in the proof of Proposition 6.3.5, we have

$$
y^\vee_{j,n} = l - y_{n-j+2,n} \quad (j \text{ is even}).
$$

Therefore,

$$
\varepsilon_0(b) = \varepsilon_n(i^\ast(b)) = \sum_{j=1}^{n} (p^\vee_{j,n})_+ \geq (p^\vee_{2,n})_+ \geq \omega^\vee_{2,n} = x^\vee_{2,n-1} = l - y^\vee_{2,n} = y_{n,n}.
$$

Note that if $n$ is odd, $i^\ast(B^{n,l}) = B(l\Lambda_{n-1}) = \tilde{B}$. The equality of (6.6.9) holds if and only if $p^\vee_{j,n} \leq 0$ for $j = 3, \ldots, n$.

**Corollary 6.6.7.** For $b \in B^{n, l}$ (resp. $B^{n-1, l}$), we have

$$
\langle c, \varepsilon(b) \rangle = \varepsilon_0(b) + \varepsilon_1(b) + 2 \sum_{k=2}^{n-2} \varepsilon_k(b) + \varepsilon_{n-1}(b) + \varepsilon_n(b) \geq l.
$$

**Proof of Theorem 1.5.3.** Let $\bar{b}$ be the unique element in $B^{n, l}$ such that $i^{(0,n)}(\bar{b})$ is the lowest element in the connected component of $B'$ that contains $i^{(0,n)}(b)$. This
is obtained by
\[
i^{(0)*}(b) = b(1, n - 1)^{m-2,n-2} \cdots b(2, 2)^{m-2,n-2} \Rightarrow b(2, 2)
\]
\[
\Rightarrow b(2, n - 1)^{m-2,n-2} \cdots b(2, 2)^{m-2,n-2} \Rightarrow b(2, 2)
\]
\[
\vdots
\]
\[
\Rightarrow b(n-1, n-1) = i^{(0)*}(b).
\]

Here \( r_{j,i} \) are determined in such a way that for each pair \( b_i(i) \to 2 \) we have \( \tilde{f}_i b_2 = 0 \). By Proposition 6.2.2, we have \( r_{j} \leq \tilde{r}_{j+1} \) (\( 1 \leq j \leq n - 2 \)) and \( \tilde{r}_j \leq \tilde{r}_{j+1} \) (\( 1 \leq j \leq n - 3 \)) where \( r_j = r_{n-j, n-j}, \tilde{r}_j = r_{n-j-1, n-j} \). With these \( r_j \) and \( \tilde{r}_j \) set
\[
b'' = \tilde{\tau}_{n-2} \tilde{\tau}_{n-3} \cdots \tilde{\tau}_1 \tilde{\tau}_{n-2} \tilde{\tau}_{n-3} \cdots \tilde{\tau}_1 b.
\]

We set \( (x''_{j,k}) = x(b'') \). We have \( x''_{j,n-1} = x''_{j,n-1}, x''_{j,n} = x''_{j,n-1}, x''_{j,n-1} = x''_{j,n-1} \).

From Proposition 6.6.4 and Proposition 6.6.6, the equality of (6.6.10) holds if \( p_{b-1,k} \geq 0 \) (\( 2 \leq k \leq n - 2 \)), \( p_{n-1,n-1} \geq 0, p_{(n,n)} \geq 0, p_{k,k} = 0 \) (\( 2 \leq k \leq n - 2 \)) and \( p_{j,j} \leq 0 \) (\( 4 \leq j \leq n \) and \( j \) is even).

Now for \( 1 \leq j \leq \lfloor (n-2)/2 \rfloor \) we consider the following statements where \( \lfloor . \rfloor \) is Gauss's symbol.

\[(A)_j \quad p_{j-2j+1,i} = 0, \quad p_{j-2j+2,i} = 0 \quad (2j \leq i \leq n - 2), \]
\[p_{n-2j+2,n} \geq 0 \text{ and } p_{n-2j+1,n-1} \geq 0. \]

\[(B)_j \quad \omega_{j-2j+1,i} = 0 \quad (2j \leq i \leq n) \text{ and } \omega_{j-2j+2,i} = 0 \quad (2j - 1 \leq i \leq n). \]

\[(C)_j \quad p'_{2j+2,n} = 0. \]

\[(D)_j \quad p'_{2j+2,n} \leq 0. \]

\[(E)_j \quad r_{n-2j-2} = r_{n-2j-1} = y_{1,2j+1} - y_{n-2j,n}, \]
\[\tilde{r}_{n-2j-2} = (y_{2,2j+2} - y_{n-2j,n}) + (y_{1,2j+2} - y_{1,2j+1}), \]
\[\tilde{r}_{n-2j-3} = y_{2,2j+2} - y_{n-2j,n}. \]

Here, the equality of (6.6.10) holds if and only if \((A)_j\) and \((D)_j\) (\( 1 \leq j \leq \lfloor (n-2)/2 \rfloor \)).

Let us show the equivalence of

(i) \((B)_j\) (\( 1 \leq j \leq \lfloor (n-2)/2 \rfloor \)).

(ii) \((A)_j\) and \((D)_j\) (\( 1 \leq j \leq \lfloor (n-2)/2 \rfloor \)).
Note that \((B)\) implies Theorem 1.5.3. Let us derive (i) from (ii). Assume that \((A)_1, \ldots, (A)_j\), and \((C)_{j-1}\) are valid. From \((A)_j\), we obtain

\[
\omega_{i, -2j+1} \geq 0 \quad (2j \leq i \leq n - 2),
\]

\[
\omega_{i, -2j+2} \geq 0 \quad (2j \leq i \leq n - 2),
\]

\[
\omega_{n-2j+2, n} \geq 0,
\]

\[
\omega_{n-2j+1, n-1} \geq 0.
\]

Also, from \(p_{-2j+1, i} \geq 0\) we obtain

\[
\omega_{i, -2j+1} \geq (-p_{-2j, i})_+ \geq -p_{i, -2j, i} = -\omega_{i, -2j, i} + (-p_{i, -2j-1, i})_+.
\]

This implies

\[
\omega_{i, -2j+1} + \omega_{i, -2j, i} \geq 0 \quad (2j + 1 \leq i \leq n - 2).
\]

From (6.6.11) and (6.6.13), we get

\[
x_{n-2j+2, n-1} \geq x_{n-2j-1, n-1} \geq x_{n-2j-2, n-2} \geq \cdots \geq x_{2, 2j+2} \geq x_{1, 2j+1}.
\]

From (6.6.14),

\[
x_{n-2j+1, n-1} \geq x_{n-2j-2, n-1}.
\]

From (6.6.12),

\[
x_{n-2j, n-1} \geq x_{n-2j-2, n-2} \geq \cdots \geq x_{2, 2j+1} \geq x_{1, 2j}.
\]

From (6.6.16)

\[
x_{n-2j+1, n-1} + x_{n-2j-2, n-1} \geq x_{n-2j-2, n-2} + x_{n-2j-3, n-2} \geq \cdots \geq x_{2, 2j+2} + x_{1, 2j+2}.
\]

From (6.6.17)–(6.6.20) we obtain

\[
y_{n-2j, n-2} - y_{n-2j+2, n} \geq y_{1, 2j+1} - y_{1, 2j},
\]

\[
y_{n-2j-1, n-2} - y_{n-2j, n-1} \geq y_{n-2j-2, n-1} - y_{n, -2j-2, n-2},
\]

\[
y_{n-2j, n-1} - y_{n-2j+2, n-2} \geq y_{2, 2j+1} - y_{2, 2j},
\]

\[
(y_{n-2j-1, n-1} - y_{n-2j-1, n-2}) + (y_{n-2j-2, n-1} - y_{n-2j-2, n-2}) \geq (y_{2, 2j+2} - y_{2, 2j+1}) + (y_{1, 2j+2} - y_{1, 2j+1}).
\]
From (6.6.17')–(6.6.20)', we obtain

\[ y_{n-2j-1,n-1} - y_{n-2j+2,n} \geq (y_{2,2j+2} - y_{2,2j}) + (y_{1,2j+1} - y_{1,2j}). \]  

(6.6.21)

Note that \( E_j \): \( r_{n-2} = y_{1,1} - y_{n,n} + \bar{r}_n - (y_{2,2} - y_{n-2,n+2}) + (y_{1,2} - y_{1,1}) \) and \( \bar{r}_n = y_{2,2} - y_{n,n} \) holds in any case and also that \( A_1, \ldots, A_j \) imply \( E_1, \ldots, E_j \).

From \( C_{{j-1}} \): \( p_{2j,n} = 0 \) we obtain

\[ p_{2j+2,n} = \omega_{2j+2,n} = x'_{2j+2,n+1} - x'_{2j-1,n-1} \cdot \]

From this and \( D_j \),

\[ x'_{2j+2,n+1} = x'_{2j-1,n-1}. \]  

(6.6.22)

Similarly to the previous cases, we get

\[ x'_{2j-1,n-1} = (y_{n-2j,n} - y_{n-2j+2,n}) - (r_{n-2j+1} - r_{n-2j-1}) - (\bar{r}_{n-2j} - \bar{r}_{n-2j-1}), \]

\[ x'_{2j+2,n+1} = \bar{r}_{n-2j-1} - \bar{r}_{n-2j-2} \cdot \]

Therefore, from (6.6.22) and these, we obtain

\[ \bar{r}_{n-2j-1} - \bar{r}_{n-2j-2} \leq (y_{n-2j,n} - y_{n-2j+2,n}) - (r_{n-2j+1} - r_{n-2j-1}) - (\bar{r}_{n-2j} - \bar{r}_{n-2j-1}). \]  

(6.6.23)

From (6.6.23), \( E_{j-1} \), and \( E_j \),

\[ (y_{2,2j+2} - y_{2,2j}) + (y_{1,2j+2} - y_{1,2j}) \geq y_{n-2j,n} - y_{n-2j+2,n} \cdot \]

(6.6.24)

From (6.6.21) and (6.6.24) we have the equalities (6.6.11–6.6.22) and (6.6.17)–(6.6.20'). Hence, we obtain \( B_1, \ldots, B_j \). In particular, from the equalities (6.6.22) we get \( \omega_{2j+2,n} = 0 \). From this and \( C_{{j-1}} \), \( p_{2j+2,n} = (-p_{2j,n})_+ = 0 \). Hence, we obtain \( C_j \). From \( \omega_{n-2j+2,n} = 0 \) in \( B_j \), \( p_{n-2j+2,n} \geq 0 \) in \( A_j \), and \( p_{n-2j+2,n} = \omega_{n-2j+2,n} = (-p_{n-2j,n})_+ \), we obtain \( p_{n-2j,n} \geq 0 \). Similarly, we obtain \( p_{n-2j-1,n} \geq 0 \). Therefore, we obtain \( A_{j+1} \) from \( A_j \) and \( B_j \). Thus, we proved (i) by assuming (ii).

Next, we show that (i) implies (ii). Note that (i) means \( \omega_{j,i} = 0 \) (1 \( \leq j \leq i \leq n \)). Also note that \( p_{1,i} \geq 0 \) (1 \( \leq i \leq n \)), \( p_{2,n} = 0 \) and \( p_{2,n} \geq 0 \). From these we can show \( p_{j,i} = 0 \) (2 \( \leq j \leq i \leq n \)) inductively. In particular, we have \( A_j \) (1 \( \leq j \leq [(n - 2)/2] \)). As noted before, \( A_1, \ldots, A_j \) imply \( E_1, \ldots, E_j \). Therefore, we get

\[ p_{2j+2,n} \leq \omega_{2j+2,n} = x'_{2j+2,n+1} - x'_{2j-1,n-1} \]

\[ = (y_{n-2j+2,n} - y_{n-2j,n}) + (y_{2,2j+2} - y_{2,2j}) + (y_{1,2j+2} - y_{1,2j}). \]  

(6.6.25)
We have

\[(6.6.26)\quad y_{n-2j+2,n} - y_{n-2j,n} = -x_{n-2j+1,n} - x_{n-2j,n},\]

\[(6.6.27)\quad y_{2,2j+2} - y_{2,2j} = x_{2,2j+2} + x_{2,2j+1},\]

\[(6.6.28)\quad y_{1,2j+2} - y_{1,2j} = x_{1,2j+2} + x_{1,2j+1}.\]

Note that if \(i = n\) or \(\bar{n}\), \(x_{j,i} = x_{j-1,n-1} + x_{j+1,n-1}\). Hence, from this and (6.6.26),

\[(6.6.29)\quad y_{n-2j+2,n} - y_{n-2j,n} = -x_{n-2j,n-1} - x_{n-2j+2,n-1} - x_{n-2j-1,n-1} - x_{n-2j+1,n-1} - x_{n-2j,n-1}.\]

From (B)\(_j\),

\[(6.6.30)\quad x_{2,2j+1} + x_{2,2j+2} = x_{n-2j-1,n-1} + x_{n-2j,n-1},\]

\[(6.6.31)\quad x_{1,2j+1} + x_{1,2j+2} = x_{n-2j-2,n-1} + x_{n-2j-1,n-1}.\]

Hence, from (6.6.25)-(6.6.31),

\[p^2_{2j+2,n} = -(x_{n-2j+2,n-1} - x_{n-2j-1,n-1}) - (x_{n-2j+1,n-1} - x_{n-2j-2,n-1}) = 0.\]

Thus, we obtain (D)\(_j\).

**PROPOSITION 6.6.8.** \(B^{n-1} \otimes B^{n-1}\) is connected.

The proof is similar to that of Proposition 6.3.10.

Now, we have completed the proof of Theorem 1.5.2 by Theorem 1.5.3, Corollary 6.6.7, Proposition 6.6.8, and Remark 1.5.4.

6.7. \((A^{(2)}_{2n-1}, B(l\Lambda_1)(n \geq 3))\). We shall use the notation in 1.6. For \(i = 1, \ldots, n\), the rule of drawing the \(i\)-arrow on \(B(l\Lambda_1)\) is given in [KN]. From that rule, it is easy to see that

\[\varepsilon_i(b) = \overline{x}_i(b) + (x_{i+1}(b) - \overline{x}_{i+1}(b))_+ \quad \text{for } i = 1, \ldots, n - 1,\]

\[(6.7.1)\quad \varphi_i(b) = x_i(b) + (\overline{x}_{i+1}(b) - x_{i+1}(b))_+ \quad \text{for } i = 1, \ldots, n - 1,\]

\[\varepsilon_n(b) = \overline{x}_n(b), \quad \varphi_n(b) = x_n(b).\]

We define a bijection \(\sigma: B(l\Lambda_1) \to B(l\Lambda_1)\) by

\[x_1(\sigma(b)) = \overline{x}_1(b), \quad \overline{x}_1(\sigma(b)) = x_1(b),\]

\[x_i(\sigma(b)) = x_i(b), \quad \overline{x}_i(\sigma(b)) = \overline{x}_i(b) \quad \text{for } i = 2, \ldots, n.\]
Then it is straightforward to see that $\sigma^2 = id_{B(l\Lambda_1)}$. Now we define the rule of 0-arrow by

$$\tilde{f}_0(b) = \sigma \tilde{f}_1 \sigma(b).$$

(6.7.2)

That is, $b \xrightarrow{0} b'$ if and only if $\sigma(b) \xrightarrow{1} \sigma(b')$. Note that

$$\varepsilon_0(b) = x_1(b) + (x_2(b) - \bar{x}_2(b))_+, \quad \phi_0(b) = \bar{x}_1(b) + (\bar{x}_2(b) - x_2(b))_+.$$

(6.7.3)

Now let us denote by $B^{1,-1}$ the crystal $B(l\Lambda_1)$ endowed with 0-arrows defined as above.

**Proof of Proposition 1.6.1.** For $b, b' \in B^{1,-1}$, by definition, $b \xrightarrow{0} b'$ if and only if $\sigma(b) \xrightarrow{1} \sigma(b')$. It immediately follows from the rule of arrows given in [KN] that $b \xrightarrow{i} b'$ if and only if $\sigma(b) \xrightarrow{i} \sigma(b')$ for $i = 2, \ldots, n$. Therefore we obtain an isomorphism $\tau_0(B^{1,-1}) \cong \tau_1(B^{1,-1}) \cong B(\Lambda_1)$ of crystals for $U_q(C_n)$ induced by the map $\sigma$. In particular, $B^{1,-1}$ is a crystal for $U_q(g_{l\Lambda(1)})$ of type $U_q(C_n)$. It remains to show the commutativity of the 0-arrow and 1-arrow. For $b \in B^{1,-1}$, by the definition of 0-arrow, we observe that if $x_2(b) \geq \bar{x}_2(b), \bar{x}_1(b) \geq 1$, then

$$x_2(\tilde{f}_0(b)) = x_2(b) + 1,$$

$$\bar{x}_1(\tilde{f}_0(b)) = \bar{x}_1(b) - 1,$$

for $i \neq 2$,

$$x_i(\tilde{f}_0(b)) = x_i(b) \quad \text{for } i \neq 1;$$

if $x_2(b) \geq \bar{x}_2(b), \bar{x}_1(b) = 0$, then $\tilde{f}_0(b) = 0$; and if $x_2(b) < \bar{x}_2(b)$, then

$$x_1(\tilde{f}_0(b)) = x_1(b) + 1,$$

$$\bar{x}_2(\tilde{f}_0(b)) = \bar{x}_2(b) - 1,$$

$$x_i(\tilde{f}_0(b)) = x_i(b) \quad \text{for } i \neq 1,$$

$$\bar{x}_i(\tilde{f}_0(b)) = \bar{x}_i(b) \quad \text{for } i \neq 2.$$

On the other hand, by the rule of arrows given in [KN], we have if $x_2(b) \geq \bar{x}_2(b)$,
$x_1(b) \geq 1$, then

$$x_1(\tilde{f}_1(n)) = x_1(b) - 1.$$  

$$x_2(\tilde{f}_1(b)) = x_2(b) + 1,$$  

$$x_i(\tilde{f}_1(b)) = x_i(b) \quad \text{for } i \neq 1, 2,$$  

$$\bar{x}_i(\tilde{f}_1(b)) = \bar{x}_i(b) \quad \text{for all } i;$$  

if $x_2(b) \geq \bar{x}_2(b)$, $x_1(b) = 0$, then $\tilde{f}_1(b) = 0$; and if $x_2(b) < \bar{x}_2(b)$, then

$$\bar{x}_1(\tilde{f}_1(b)) = \bar{x}_1(b) + 1,$$  

$$x_2(\tilde{f}_1(b)) = \bar{x}_2(b) - 1,$$  

$$x_i(\tilde{f}_1(b)) = x_i(b) \quad \text{for all } i,$$  

$$\bar{x}_i(\tilde{f}_1(b)) = \bar{x}_i(b) \quad \text{for } i \neq 1, 2.$$  

Now it is straightforward to check that $\tilde{f}_0 \tilde{f}_1 = \tilde{f}_1 \tilde{f}_0$.

To prove the uniqueness of $B^{1, l}$, we need the following proposition.

**Proposition 6.7.1.** Let $J' = \{2, \ldots, n\}$ be the index set for the simple roots of $U_q(C_{n-1})$ and define a map $\iota': J' \to I$ by $\iota'(j) = j$ for $j \in J'$. Then $\iota'^* (B^{1, l})$ splits into a direct sum of mutually distinct crystals for $U_q(C_{n-1})$ with highest weight

$$(\bar{t}_1 - t_1 - t_2)\Lambda_0 + (t_1 - \bar{t}_1 - t_2)\Lambda_1 + t_2 \Lambda_2,$$

where $t_1, t_2, \bar{t}_1$ are nonnegative integers such that $t_1 + t_2 + \bar{t}_1 = l$.

**Proof.** Let $b$ be an element of $B^{1, l}$ with $x_i(b) = t_i$, $\bar{x}_i(b) = \bar{t}_i$ for $i = 1, \ldots, n$. Then $b$ is a highest-weight element of $\iota'^* (B^{1, l})$ if and only if $\bar{t}_2 = 0$, $t_i = \bar{t}_i = 0$ for $i = 3, \ldots, n$. In this case, the weight of $b$ is

$$(\bar{t}_1 - t_1 - t_2)\Lambda_0 + (t_1 - \bar{t}_1 - t_2)\Lambda_1 + t_2 \Lambda_2.$$

It is clear that $t_1 + t_2 + \bar{t}_1 = l$, and it is easy to see that there is at most one highest element in $\iota'^* (B^{1, l})$ with a given highest weight. $\square$

Now we prove the uniqueness of $B^{1, l}$.

**Theorem 6.7.2.** Let $B$ be a crystal for $U_q(A^{(2)}_{2n-1})$ such that $\iota_0^* (B) \cong B(l\Lambda_1)$ and $\iota_0^* (B) \cong B(l\Lambda_1)$ as crystals for $U_q(C_n)$. Then there exists a unique isomorphism $\psi: B^{1, l} \to B$ as crystals for $U_q(A^{(2)}_{2n-1})$. 
Proof. Let \( \psi_0 : t_{\mathfrak{g}}^1(B^{1,1}) \rightarrow t_{\mathfrak{h}}^1(B) \) and \( \psi_1 : t_{\mathfrak{g}}^1(B^{1,1}) \rightarrow t_{\mathfrak{h}}^1(B) \) be the isomorphisms of crystals for \( U_q(\mathfrak{c}_n) \). Observe that \( t_{\mathfrak{g}}^1(B) \) splits into a direct sum of mutually distinct crystals with highest weight for \( U_q(\mathfrak{c}_n) \). Therefore, \( \psi_0 \) and \( \psi_1 \) must coincide on highest-weight elements of \( U_q(\mathfrak{c}_n) \), and hence for all elements of \( B^{1,1} \). Thus we obtain a unique isomorphism \( \psi : B^{1,1} \rightarrow B \) as crystals for \( U_q(\mathfrak{c}_{2n-1}) \).

In Section 5 we proved that there exists a finite-dimensional irreducible representation \( V \) of \( U_q(A_{2n-1}^{(2)}) \) with crystal base \( (L, B) \) such that \( t_{\mathfrak{g}}^1(B) \cong B(\Lambda_1) \) and \( t_{\mathfrak{h}}^1(B) \cong B(\Lambda_1) \) as crystals for \( U_q(\mathfrak{c}_n) \). Hence by Theorem 6.7.2, there is a unique isomorphism \( B^{1,1} \cong B \) as crystals for \( U_q(A_{2n-1}^{(2)}) \). Hence, we have completed the proof of Proposition 1.6.1.

Proposition 6.7.3. The crystal \( B^{1,1} \otimes B^{1,1} \) is connected.

Proof. It is similar to Proposition 6.3.10.

Proof of Theorem 1.6.2 and Theorem 1.6.3. We first show that \( \langle c, e(b) \rangle \geq l \) for all \( b \in B^{1,1} \). Since \( c = h_0 + h_1 + 2h_2 + \cdots + 2h_{n-1} + 2h_n \), we have from (6.7.1) and (6.7.3)

\[
(6.7.4) \quad \langle c, e(b) \rangle = x_1(b) + \overline{x}_1(b) + 2 \sum_{i=2}^n (\overline{x}_i(b) + (x_i(b) - \overline{x}_i(b)))_i.
\]

Set \( S_0 = \{ j \in J' | x_j(b) = \overline{x}_j(b) \} \), \( S_1 = \{ j \in J' | x_j(b) > \overline{x}_j(b) \} \), and \( S_2 = \{ j \in J' | x_j(b) < \overline{x}_j(b) \} \). Then (6.7.4) becomes

\[
(6.7.5) \quad \langle c, e(b) \rangle = x_1(b) + \overline{x}_1(b) + 2 \sum_{j \in S_0} \overline{x}_j(b) + 2 \sum_{j \in S_1} x_j(b) + 2 \sum_{j \in S_2} \overline{x}_j(b)
\]

\[
\quad \geq x_1(b) + \overline{x}_1(b) + \sum_{j \in S_0} (x_j(b) + \overline{x}_j(b))
\]

\[
\quad + \sum_{j \in S_1} (x_j(b) + \overline{x}_j(b)) + \sum_{j \in S_2} (x_j(b) + \overline{x}_j(b))
\]

\[
\quad = \sum_{i=1}^n x_i(b) + \sum_{i=1}^n \overline{x}_i(b) = l.
\]

Now let \( \Lambda = \sum_{i=0}^n k_i \Lambda_i \) be a dominant integral weight of level \( l \), i.e.,

\[
(6.7.6) \quad \langle \Lambda, c \rangle = k_0 + k_1 + 2k_2 + \cdots + 2k_{n-1} + 2k_n = l.
\]

We will show that there exists a unique element \( b \in B^{1,1} \) such that \( \epsilon_i(b) = k_i \) for all \( i = 0, \ldots, n \). For existence, we take \( b \in B^{1,1} \) with

\[
x_1(b) = k_0,
\]

\[
\overline{x}_1(b) = k_1,
\]

\[
x_i(b) = \overline{x}_i(b) = k_i \quad \text{for} \quad i = 2, \ldots, n.
\]

Then it is easy to see that \( \epsilon_i(b) = k_i \) for \( i = 0, 1, \ldots, n \).
For the uniqueness, let \( b' \) be an element of \( B^{1,1} \) such that \( \varepsilon_i(b') = k_i \) for all \( i = 0, 1, \ldots, n \). Then \( \langle c, e(b') \rangle = l \). In (6.7.5), the equality holds if and only if \( S_1 = S_2 = \phi \), i.e., \( x_i(b') = \overline{x}_i(b') \) for all \( i = 2, \ldots, n \). Hence we have

\[
\varepsilon_0(b') = x_1(b') = k_0,
\]

\[
\varepsilon_1(b') = \overline{x}_1(b') = k_1,
\]

\[
\varepsilon_i(b') = x_i(b') = \overline{x}_i(b') = k_i \quad \text{for} \quad i = 2, \ldots, n,
\]

which completes the proof of Theorem 1.6.3, and then by the arguments above, Remark 1.6.4, and Proposition 6.7.3, we have completed the proof of Theorem 1.6.2.

\[\square\]

**Proposition 6.7.4.** Let \( \Lambda \) and \( b \) be as in the proof of Theorem 1.6.2. Then we have

\[\Lambda' = \Lambda + af(wt(b)) = k_1\Lambda_0 + k_0\Lambda_1 + \sum_{i=2}^{n} k_i\Lambda_i,\]

and the minimal vector \( b' \) for \( \Lambda' \) is given by

\[
x_1(b') = k_1, \quad \overline{x}_1(b') = k_0,
\]

\[
x_i(b') = \overline{x}_i(b') = k_i \quad \text{for} \quad i = 2, \ldots, n.
\]

Thus the ground-state path of weight \( \Lambda \) is the sequence \((b', b, b', b, b', b, \ldots)\).

6.8. \((B_1^{(1)}, B(l\Lambda_1) \quad (n \geq 3))\). First, note that the proof of Proposition 1.7.1 is similar to that of Proposition 1.6.1.

We shall use the notations in 1.7. For \( i = 1, \ldots, n \), the rule of drawing \( i \)-arrow on \( B(l\Lambda_1) \) is given in [KN]. From that rule, it is easy to see that

\[
\varepsilon_i(b) = \overline{x}_i(b) + (x_{i+1}(b) - \overline{x}_{i+1}(b))^+ \quad \text{for} \quad i = 1, \ldots, n - 1,
\]

(6.8.1)

\[
\varphi_i(b) = x_i(b) + (\overline{x}_{i+1}(b) - x_{i+1}(b))^+ \quad \text{for} \quad i = 1, \ldots, n - 1,
\]

\[
\varepsilon_n(b) = 2\overline{x}_n(b) + x_0(b), \quad \varphi_n(b) = 2x_n(b) + x_0(b).
\]

We define a bijection \( \sigma: B(l\Lambda_1) \to B(l\Lambda_1) \) by

\[
x_0(\sigma(b)) = x(b), \quad x_1(\sigma(b)) = \overline{x}_1(b), \quad \overline{x}_1(\sigma(b)) = x_1(b),
\]

\[
x_i(\sigma(b)) = x_i(b), \quad \overline{x}_i(\sigma(b)) = \overline{x}_i(b) \quad \text{for} \quad i = 2, \ldots, n.
\]
It is easy to see that $\sigma^2 = id_{B(\Lambda_1)}$. Now we define the rule of 0-arrow by

\[ f_0(b) = \sigma f_1 \sigma(b). \]

That is, $b \xrightarrow{0} b'$ if and only if $\sigma(b) \xrightarrow{1} \sigma(b')$. Note that

\[ \varepsilon_0(b) = x_1(b) + (x_2(b) - \bar{x}_2(b))_+ , \]

\[ \varphi_0(b) = \bar{x}_1(b) + (\bar{x}_2(b) - x_2(b))_+ . \]

Let us denote by $B^{1,1}$ the crystal $B(l\Lambda_1)$ endowed with 0-arrows.

**Proof of Proposition 1.7.1.** To prove the uniqueness of $B^{1,1}$, we need the following result.

**Proposition 6.8.1.** Let $J' = \{2, \ldots, n\}$ be the index set for the simple roots for $U_q(B_n)$ and define a map $i': J' \to I$ by $i'(j) = j$ for $j \in J'$. Then $i'^*(B^{1,1})$ splits into a direct sum of mutually distinct crystals for $U_q(B_{n-1})$ with highest weight

\[ (\bar{t}_1 - t_1 - t_2)\Lambda_0 + (t_1 - \bar{t}_1 - t_2)\Lambda_1 + t_2\Lambda_2 , \]

where $t_1, t_2, \bar{t}_1$ are nonnegative integers such that $t_1 + t_2 + \bar{t}_1 = l$.

**Proof.** It is similar to Proposition 6.7.1. \qed

Now we prove the uniqueness of $B^{1,1}$.

**Theorem 6.8.2.** Let $B$ be a crystal for $U_q(B^{1,1}_n)$ such that $i_0^*(B) \cong B(l\Lambda_1)$ and $i_1^*(B) \cong B(l\Lambda_1)$ as crystals for $U_q(B_n)$. Then there exists a unique isomorphism $\psi: B^{1,1} \to B$ as crystals for $U_q(B^{1,1}_n)$.

**Proof.** It is similar to Proposition 6.7.2 using Proposition 6.8.1 instead of Proposition 6.7.1. \qed

In Section 5 we proved that there exists a finite-dimensional irreducible representation $V$ of $U_q(B^{1,1}_n)$ with crystal base $(L, B)$ such that $i_0^*(B) \cong B(l\Lambda_1)$ and $i_1^*(B) \cong B(l\Lambda_1)$ as crystals for $U_q(B_n)$. Hence by Theorem 6.8.2, there is a unique isomorphism $B^{1,1} \cong B$ as crystals for $U_q(B^{1,1}_n)$. Now, we have completed the proof of Proposition 1.7.1. \qed

**Proposition 6.8.3.** The crystal $B^{1,1} \otimes B^{1,1}$ is connected.

**Proof.** It is similar to Proposition 6.3.10. \qed

**Proof of Theorem 1.7.2 and Theorem 1.7.3.** We first show that $\langle c, \varepsilon(b) \rangle \geq l$ for all $b \in B^{1,1}$. Since $c = h_0 + h_1 + 2h_2 + \cdots + 2h_{n-1} + h_n$, we have from (6.8.1) and (6.8.3),

\[ \langle c, \varepsilon(b) \rangle = x_1(b) + \bar{x}_1(b) + 2 \sum_{i=2}^n (\bar{x}_i(b) + x_i(b) - \bar{x}_i(b))_+ + x_0(b) . \]
Set \( S_0 = \{ j \in J' \mid x_j(b) = \overline{x}_j(b) \} \), \( S_1 = \{ j \in J' \mid x_j(b) > \overline{x}_j(b) \} \), and \( S_2 = \{ j \in J' \mid x_j(b) < \overline{x}_j(b) \} \). Then by (6.8.4) we have

(6.8.5) \[
\langle c, \delta(b) \rangle = x_0(b) + x_1(b) + \overline{x}_1(b) + 2 \sum_{j \in S_2} \overline{x}_j(b) \\
+ 2 \sum_{j \in S_1} x_j(b) + 2 \sum_{j \in S_0} \overline{x}_j(b) \\
\geq x_0(b) + x_1(b) + \overline{x}_1(b) + \sum_{j \in S_0} (x_j(b) + \overline{x}_j(b)) \\
+ \sum_{j \in S_1} (x_j(b) + \overline{x}_j(b)) + \sum_{j \in S_2} (x_j(b) + \overline{x}_j(b)) \\
= x_0(b) + \sum_{i=1}^{n} x_i(b) + \sum_{i=1}^{n} \overline{x}_i(b) = l.
\]

Now let \( \Lambda = \sum_{i=0}^{n} k_i \Lambda_i \) be a dominant integral weight of level \( l \), i.e.,

(6.8.6) \[
\langle \Lambda, c \rangle = k_0 + k_1 + 2k_2 + \cdots + 2k_{n-1} + k_n = l.
\]

We will show that there exists a unique element \( b \in B^{1,l} \) such that \( c_i(b) = k_i \) for all \( i = 0, \ldots, n \). For existence, we take \( b \in B^{1,l} \) with

\[
x_0(b) = 0 \quad \text{if } k_n \text{ is even,} \\
= 1 \quad \text{if } k_n \text{ is odd,}
\]

\[
x_1(b) = k_0, \quad \overline{x}_1(b) = k_1,
\]

\[
x_i(b) = \overline{x}_i(b) = k_i \quad \text{for } i = 2, \ldots, n-1,
\]

\[
x_n(b) = \overline{x}_n(b) = \frac{k_n - x_0(b)}{2}.
\]

The proof of the uniqueness is similar to the argument in the proof of Theorem 1.6.2. Hence, we have completed the proof of Theorem 1.7.3 and then that of Theorem 1.7.2 by the arguments above, Remark 1.7.4, and Proposition 6.8.3. \( \square \)

**Proposition 6.8.4.** Let \( \Lambda \) and \( b \) be as in the proof of Theorem 1.7.2. Then we have

\[
\Lambda' = \Lambda + af(wt(b)) = k_1 \Lambda_0 + k_0 \Lambda_1 + \sum_{i=2}^{n} k_i \Lambda_i,
\]
and the minimal vector $b'$ for $\Lambda$ is given by

\[
x_1(b') = k_1, \quad \bar{x}_1(b') = k_0, \\
x_i(b') = \bar{x}_i(b') = k_i \quad \text{for } i = 2, \ldots, n.
\]

Thus the ground-state path of weight $\Lambda$ is the sequence $(b', b, b', b', b', \ldots)$.

6.9. $(D_n^{(1)}, B(l\Lambda_1) \ (n \geq 4))$. First, note that the proof of Proposition 1.8.1 is similar to that of Proposition 1.6.1.

We shall use the notations in 1.8. For $i = 1, \ldots, n$, the rule of drawing the $i$-arrow on $B(l\Lambda_1)$ is given in [KN]. From that rule, it is easy to see that

\[
\begin{align*}
\epsilon_i(b) &= \bar{x}_i(b) + (x_{i+1}(b) - \bar{x}_{i+1}(b))_+ \quad \text{for } i = 1, \ldots, n - 2, \\
\phi_i(b) &= x_i(b) + (\bar{x}_{i+1}(b) - x_{i+1}(b))_+ \quad \text{for } i = 1, \ldots, n - 2, \\
\epsilon_{n-1}(b) &= \bar{x}_{n-1}(b) + x_n(b), \quad \phi_{n-1}(b) = x_{n-1}(b) + \bar{x}_n(b), \\
\epsilon_n(b) &= \bar{x}_{n-1}(b) + \bar{x}_n(b), \quad \phi_n(b) = x_{n-1}(b) + x_n(b).
\end{align*}
\]

(6.9.1)

We define a bijection $\sigma : B(l\Lambda_1) \to B(l\Lambda_1)$ by

\[
\begin{align*}
x_1(\sigma(b)) &= \bar{x}_1(b), \quad \bar{x}_1(\sigma(b)) = x_1(b), \\
x_i(\sigma(b)) &= x_i(b), \quad \bar{x}_i(\sigma(b)) = \bar{x}_i(b) \quad \text{for } i = 2, \ldots, n.
\end{align*}
\]

It is easy to see that $\sigma^2 = id_{B(l\Lambda_1)}$. Now we define the rule of the 0-arrow by

\[
(6.9.2) \\
f_0(b) = \sigma_1 f_1 \sigma(b).
\]

That is, $b \xrightarrow{0} b'$ if and only if $\sigma(b) \xrightarrow{1} \sigma(b')$. Note that

\[
\begin{align*}
\epsilon_0(b) &= x_1(b) + (x_2(b) - \bar{x}_2(b))_+, \\
\phi_0(b) &= \bar{x}_1(b) + (\bar{x}_2(b) - x_2(b))_+.
\end{align*}
\]

(6.9.3)

Let us denote by $B^{1,1}$ the crystal $B(l\Lambda_1)$ endowed with 0-arrows.

Proof of Proposition 1.8.1. For the uniqueness of $B^{1,1}$, we need the following result.

Proposition 6.9.1. Let $J' = \{2, \ldots, n\}$ be the index set for the simple roots for $U_q(D_{n-1})$ and define a map $i' : J' \to I$ by $i'(j) = j$ for $j \in J'$. Then $i'^*(B^{1,1})$ splits into a
direct sum of mutually distinct crystals for $U_q(D_{n-1})$ with highest weight

$$(t_1 - t_1 - t_2)\Lambda_0 + (t_1 - \tilde{t}_1 - t_2)\Lambda_1 + t_2\Lambda_2,$$

where $t_1, t_2, \tilde{t}_1$ are nonnegative integers such that $t_1 + t_2 + \tilde{t}_1 = l$.

Proof. It is similar to Proposition 6.7.1. □

Now we have the uniqueness of $B^{1,1}$.

Theorem 6.9.2. Let $B$ be a crystal for $U_q(D^{(1)}_n)$ such that $i_\sigma^*(B) \cong B(l\Lambda_1)$ and $i_\tau^*(B) \cong B(l\Lambda_1)$ as crystals for $U_q(D_n)$. Then there exists a unique isomorphism $\psi: B^{1,1} \to B$ as crystals for $U_q(D^{(1)}_n)$.

Proof. Similar to Proposition 6.7.2 using Proposition 6.9.1 instead of Proposition 6.7.1. □

In Section 5 we proved that there exists a finite-dimensional irreducible representation $V$ of $U_q(D^{(1)}_n)$ with crystal base $(L, B)$ such that $i_\sigma^*(B) \cong B(l\Lambda_1)$ and $i_\tau^*(B) \cong B(l\Lambda_1)$ as crystals for $U_q(D_n)$. Hence by Theorem 6.9.2, there is a unique isomorphism $B^{1,1} \cong B$ as crystals for $U_q(D^{(1)}_n)$. Now we have completed the proof of Proposition 1.8.1. □

Proposition 6.9.3. The crystal $B^{1,1} \otimes B^{1,1}$ is connected.

Proof. It is similar to Proposition 6.3.10. □

Proof of Theorem 1.8.2 and Theorem 1.8.3. We first show that $\langle c, e(b) \rangle \geq l$ for all $b \in B^{1,1}$. Since $c = h_0 + h_1 + 2h_2 + \cdots + 2h_{n-2} + h_{n-1} + h_n$, we have from (6.9.1) and (6.9.3),

$$\langle c, e(b) \rangle = x_1(b) + \bar{x}_1(b) + 2 \sum_{i=2}^{n-1} (\bar{x}_i(b) + (x_i(b) - \bar{x}_i(b))) + x_n(b) + \bar{x}_n(b).$$

Set $S_0 = \{ j = 2, \ldots, n - 1 | x_j(b) = \bar{x}_j(b) \}$, $S_1 = \{ j = 2, \ldots, n - 1 | x_j(b) > \bar{x}_j(b) \}$, and $S_2 = \{ j = 2, \ldots, n - 1 | x_j(b) < \bar{x}_j(b) \}$. Then by (6.9.4) we have

$$\langle c, e(b) \rangle = x_1(b) + \bar{x}_1(b) + 2 \sum_{j \in S_0} \bar{x}_j(b) + 2 \sum_{j \in S_1} x_j(b)$$

$$+ 2 \sum_{j \in S_2} \bar{x}_j(b) + x_n(b) + \bar{x}_n(b)$$

$$\geq x_1(b) + \bar{x}_1(b) + \sum_{j \in S_0} (x_j(b) + \bar{x}_j(b)) + \sum_{j \in S_1} (x_j(b) + \bar{x}_j(b))$$

$$+ \sum_{j \in S_2} (x_j(b) + \bar{x}_j(b)) + x_n(b) + \bar{x}_n(b)$$

$$= \sum_{i=1}^n x_i(b) + \sum_{i=1}^n \bar{x}_i(b) = l.$$
Now let $\Lambda = \sum_{l=0}^{n} k_l \Lambda_l$ be a dominant integral weight of level $l$, i.e.,

\[ \langle \Lambda, c \rangle = k_0 + k_1 + 2k_2 + \cdots + 2k_{n-2} + k_{n-1} + k_n = l. \]

We will show that there exists a unique element $b \in B^{1,l}$ such that $\epsilon_i(b) = k_i$ for all $i = 0, \ldots, n$. For existence, we take $b \in B^{1,l}$ with

\[
\begin{align*}
    x_1(b) &= k_0, & \bar{x}_1(b) &= k_1, \\
    x_i(b) &= \bar{x}_i(b) = k_i & \text{for } i = 2, \ldots, n-2, \\
    x_{n-1}(b) &= \bar{x}_{n-1}(b) = \min(k_{n-1}, k_n) \\
    x_n(b) &= (k_{n-1} - k_n)_+, \\
    \bar{x}_n(b) &= (k_n - k_{n-1})_+.
\end{align*}
\]

The proof of uniqueness is similar to the argument in the proof of Theorem 1.6.2. Hence, we have completed the proof of Theorem 1.8.3 and then that of Theorem 1.8.2 by the arguments above, Remark 1.8.4, and Proposition 6.9.3.

**Proposition 6.9.4.** Let $\Lambda$ and $b$ be as in the proof of Theorem 1.8.2. Then we have

\[ \Lambda' = \Lambda + af(wt(b)) = k_1 \Lambda_0 + k_0 \Lambda_1 + \sum_{i=2}^{n-2} k_i \Lambda_i + k_n \Lambda_{n-1} + k_{n-1} \Lambda_n, \]

and the minimal vector $b'$ for $\Lambda'$ is given by

\[
\begin{align*}
    x_1(b') &= k_1, & \bar{x}_1(b') &= k_0, \\
    x_i(b') &= \bar{x}_i(b') = k_i & \text{for } i = 2, \ldots, n-2, \\
    x_{n-1}(b) &= \bar{x}_{n-1}(b) = \min(k_{n-1}, k_n) \\
    x_n(b) &= (k_n - k_{n-1})_+, \\
    \bar{x}_n(b) &= (k_{n-1} - k_n)_+.
\end{align*}
\]

Thus the ground-state path of weight $\Lambda$ is the sequence $(b', b, b', b, b', b', \ldots)$.

6.10. ($D_{n+1}^{(2)}$, $B(0) \oplus B(\Lambda_1) \oplus \cdots \oplus B(l\Lambda_1)$ ($n \geq 2$)). We shall use the notation in 1.9. For $i = 1, \ldots, n$, the rule of drawing the $i$-arrow on $B$ is given in [KN]. From
that rule, for \( b \in \tilde{B} \) and \( i = 1, \ldots, n - 1 \), we observe that, if \( x_{i+1}(b) \geq \overline{x}_{i+1}(b) \), \( x_i(b) \geq 1 \), then

\[
\begin{align*}
  x_i(\tilde{f}_i(b)) &= x_i(b) - 1, \\
  x_{i+1}(\tilde{f}_i(b)) &= x_{i+1}(b) + 1,
\end{align*}
\]

(6.10.1)

\[
\begin{align*}
  x_j(\tilde{f}_i(b)) &= x_j(b) \quad \text{for } j \neq i, i + 1, \\
  \overline{x}_j(\tilde{f}_i(b)) &= \overline{x}_j(b) \quad \text{for } j = 1, \ldots, n;
\end{align*}
\]

if \( x_{i+1}(b) \geq \overline{x}_{i+1}(b) \), \( x_i(b) = 0 \), then \( \tilde{f}_i(b) = 0 \); and if \( x_{i+1}(b) < \overline{x}_{i+1}(b) \), then

\[
\begin{align*}
  \overline{x}_i(\tilde{f}_i(b)) &= \overline{x}_i(b) + 1, \\
  \overline{x}_{i+1}(\tilde{f}_i(b)) &= \overline{x}_{i+1}(b) - 1,
\end{align*}
\]

(6.10.2)

\[
\begin{align*}
  x_j(\tilde{f}_i(b)) &= x_j(b) \quad \text{for } j \neq i, i + 1, \\
  x_j(\tilde{f}_i(b)) &= x_j(b) \quad \text{for } j = 0, 1, \ldots, n.
\end{align*}
\]

We also note that if \( x_0(b) = 1 \), then

\[
\begin{align*}
  x_0(\tilde{f}_0(b)) &= 0, \\
  \overline{x}_n(\tilde{f}_0(b)) &= \overline{x}_n(b) + 1,
\end{align*}
\]

(6.10.3)

\[
\begin{align*}
  \overline{x}_i(\tilde{f}_0(b)) &= \overline{x}_i(b) \quad \text{for } i = 1, \ldots, n - 1, \\
  x_i(\tilde{f}_0(b)) &= x_i(b) \quad \text{for } i = 1, \ldots, n;
\end{align*}
\]

if \( x_0(b) = 0 \), \( x_n(b) \geq 1 \), then

\[
\begin{align*}
  x_0(\tilde{f}_0(b)) &= 1, \\
  x_n(\tilde{f}_0(b)) &= x_n(b) - 1,
\end{align*}
\]

(6.10.4)

\[
\begin{align*}
  x_i(\tilde{f}_0(b)) &= x_i(b) \quad \text{for } i = 1, \ldots, n - 1, \\
  \overline{x}_i(\tilde{f}_0(b)) &= \overline{x}_i(b) \quad \text{for } i = 1, \ldots, n;
\end{align*}
\]

and if \( x_0(b) = 0 \), \( x_n(b) = 0 \), then \( \tilde{f}_0(b) = 0 \). It easily follows that, for \( i = 1, \ldots, n - 1 \),

\[
\begin{align*}
  \varepsilon_i(b) &= \overline{x}_i(b) + (x_{i+1}(b) - \overline{x}_{i+1}(b))_+, \\
  \varphi_i(b) &= x_i(b) + (\overline{x}_{i+1}(b) - x_{i+1}(b))_+.
\end{align*}
\]
\[ \varepsilon_n(b) = 2\bar{x}_n(b) + x_0(b), \]
\[
\varphi_n(b) = 2x_n(b) + x_0(b). \tag{6.10.6}
\]

We define a bijection \( \sigma : \tilde{B} \to \tilde{B} \) as follows. Let \( b = (b_k)_{k=1}^{n-1} \in B(j\Lambda_1). \) For \( i = 1, \ldots, n-1, \) we define
\[ x_i(\sigma(b)) = (x_{n-i+1}(b) - x_{n-i+1}(b))_+ + \min(x_{n-i}(b), \bar{x}_{n-i}(b)), \]
\[ \bar{x}_i(\sigma(b)) = (x_{n-i+1}(b) - \bar{x}_{n-i+1}(b))_+ + \min(x_{n-i}(b), \bar{x}_{n-i}(b)). \tag{6.10.7} \]

We also define
\[ x_0(\sigma(b)) = 0 \quad \text{if } l - s(b) \text{ is even}, \]
\[ = 1 \quad \text{if } l - s(b) \text{ is odd}, \]
\[ x_n(\sigma(b)) = \left[ \frac{l - s(b)}{2} \right] + (x_1(b) - x_1(b))_+, \tag{6.10.8} \]
\[ \bar{x}_n(\sigma(b)) = \left[ \frac{l - s(b)}{2} \right] + (x_1(b) - \bar{x}_1(b))_+, \tag{6.10.9} \]

where \( \lfloor x \rfloor \) denotes the greatest integer \( \leq x. \) Then it is straightforward to see that \( \sigma^2 = id_{B_{11}}. \) Note that \( s(\sigma(b)) = l - t(b), \) where \( t(b) = x_0(b) + 2 \min(x_n(b), \bar{x}_n(b)). \)

Now we define the rule of the 0-arrow by
\[ \tilde{f}_0(b) = \sigma \tilde{f}_0 \sigma(b). \tag{6.10.10} \]

That is, \( b \sigma_0 b' \) if and only if \( \sigma(b) \rightarrow_0 \sigma(b'). \) Observe that if \( s(b) \leq l - 1 \) and \( x_1(b) \geq \bar{x}_1(b), \) then
\[ x_1(\tilde{f}_0(b)) = x_1(b) + 1, \]
\[ x_i(\tilde{f}_0(b)) = x_i(b) \quad \text{for } i = 2, \ldots, n, \tag{6.10.11} \]
\[ \bar{x}_i(\tilde{f}_0(b)) = \bar{x}_i(b) \quad \text{for } i = 1, \ldots, n, \]
\[ x_0(\tilde{f}_0(b)) = x_0(b); \]
if \( s(b) = l, x_1(b) \geq \bar{x}_1(b) \), then \( \tilde{f}_0(b) = 0 \); and if \( x_1(b) < \bar{x}_1(b) \), then

\[
x_i(\tilde{f}_0(b)) = x_i(b) \quad \text{for } i = 0, 1, \ldots, n,
\]

(6.10.12)

\[
\bar{x}_1(\tilde{f}_0(b)) = \bar{x}_1(b) - 1,
\]

\[
\bar{x}_i(\tilde{f}_0(b)) = \bar{x}_i(b) \quad \text{for } i = 2, \ldots, n.
\]

Thus we have

\[
ev_0(b) = l - s(b) + 2(x_1(b) - \bar{x}_1(b))^+,
\]

(6.10.13)

\[
\varphi_0(b) = l - s(b) + 2(\bar{x}_1(b) - x_1(b))^+.
\]

Let us denote by \( B^{1,l} \) the crystal \( \tilde{B} \) endowed with 0-arrows defined as above.

Proof of Proposition 1.9.1. By (6.10.1)–(6.10.4) and (6.10.7)–(6.10.9), it is straightforward to check that \( b \Rightarrow b' \) if and only if \( \sigma(b) \leftrightarrow \sigma(b') \) for \( i = 1, \ldots, n - 1 \). It is immediate from the definition that \( \sigma(b) \Rightarrow b' \) if and only if \( \sigma(b) \leftrightarrow \sigma(b') \). Therefore, we obtain an isomorphism of crystals for \( U_q(B_n) \) induced by the map \( \sigma \):

\[
i_n^\sigma(B^{1,l}) \cong \iota_n^\sigma(B^{1,l}) \cong B(0) \oplus B(\Lambda_1) \oplus \cdots \oplus B(l\Lambda_1).
\]

In particular, \( B^{1,l} \) is a crystal for \( U_q(\mathfrak{sp}_{2n \setminus \{n\}}) \) of type \( U_q(B_n) \). By (6.10.3), (6.10.4), and (6.10.11)–(6.10.13), it is easy to check that \( \tilde{f}_0 \tilde{f}_n = \tilde{f}_n \tilde{f}_0 \).

**Proposition 6.10.1.** Let \( J' = \{1, \ldots, n-1\} \) be the index set for the simple roots for \( U_q(\mathfrak{sl}(n)) \) and define a map \( \iota' : J' \to I \) by \( \iota'(j) = j \) for \( j \in J' \). Then \( \iota'^\ast(B^{1,l}) \) splits into a direct sum of crystals for \( U_q(\mathfrak{sl}(n)) \) with highest weight

\[-2t_1 \Lambda_0 + t_1 \Lambda_1 + (\bar{t}_n - t_n) \Lambda_{n-1} + 2(t_n - \bar{t}_n) \Lambda_n,
\]

where \( t_1, t_n, \bar{t}_n \) are nonnegative integers such that \( t_n \leq \bar{t}_n, t_1 + t_n + \bar{t}_n \leq l \).

**Proof.** Let \( b \) be an element of \( B^{1,l} \) with \( x_i(b) = t_i, \bar{x}_i(b) = \bar{t}_i \) (\( i = 1, \ldots, n \)) and \( x_0(b) = t_0 \). Then \( b \) is a highest-weight element of \( \iota'^\ast(B^{1,l}) \) if and only if \( \bar{t}_1 = 0, t_n \leq \bar{t}_n \), and \( t_i = \bar{t}_i = 0 \) for \( i = 1, \ldots, n - 1 \). In this case, the weight of \( b \) is

\[-2t_1 \Lambda_0 + t_1 \Lambda_1 + (\bar{t}_n - t_n) \Lambda_{n-1} + 2(t_n - \bar{t}_n) \Lambda_n.
\]

It is clear that \( t_1 + t_n + \bar{t}_n \leq l \). \( \square \)

Now we prove the uniqueness of \( B^{1,l} \).

**Theorem 6.10.2.** Let \( B \) be a crystal for \( U_q(D_{n+1}^{(2)}) \) such that

\[
i_n^\sigma(B) \cong B(0) \oplus B(\Lambda_1) \oplus \cdots \oplus B(l\Lambda_1)
\]
and
\[ t_n^* (B) \cong B(0) \oplus B(\Lambda_1) \oplus \cdots \oplus B(l\Lambda_1) \]

as crystals for \( U_q(B_n) \). Then there exists a unique isomorphism \( \psi : B^{1,1} \rightarrow B \) as crystals for \( U_q(D_{n+1}^{(1)}) \).

Let \( \psi_0 : t_0^* (B^{1,1}) \rightarrow t_0^* (B) \) and \( \psi_n : t_n^* (B^{1,1}) \rightarrow t_n^* (B) \) be the isomorphisms of crystals for \( U_q(B_n) \). We wish to show that \( \psi_0 \) and \( \psi_n \) coincide on every element of \( B^{1,1} \). We first prove the following lemma.

Lemma 6.10.3. Let \( b = (b_k)_{k=1}^j \) be an element of \( B^{1,1} \) such that \( b_k = 1 \) for all \( k = 1, \ldots, j \). Then \( \psi_n(b) = \psi_0(b) \).

Proof. We use a downward induction on \( j \). If \( j = l \), it is obvious. Suppose \( j < l \). Since \( b \) is a highest-weight element of \( t^* (B^{1,1}) \) with highest weight \(-2j\Lambda_0 + j\Lambda_1\), \( \psi_n(b) \) is also a highest-weight element of \( t^* (B) \) with the same highest weight. Therefore, \( \psi_n(b) = \psi_0(b') \) for some highest-weight element \( b' \) of \( t^* (B^{1,1}) \) with highest weight \(-2j\Lambda_0 + j\Lambda_1\). Thus by Proposition 6.10.1, \( b' \) has the form \( x_i(b') = j, x_i(b') = x_i(b) = 0 \), for \( i = 1, \ldots, n - 1 \), \( x_n(b') = x_n(b') = t \), and \( x_0(b') = t_0 \), where \( t \) is a nonnegative integer, \( t_0 = 0 \) or \( 1 \), and \( j + 2t + t_0 < l \).

Note that \( b' = f_n^{2j+2t+t_0} \cdots f_1^{2j+2t+t_0} b_0 \), where \( b_0 = (b_0, k = 1, \ldots, j + 2t + t_0 \). Then we have

(6.10.14)
\[
\psi_n(b) = \psi_0(b') = \psi_0(f_n^{2j+2t+t_0} \cdots f_1^{2j+2t+t_0} b_0)
\]
\[
= f_n^{2j+2t+t_0} \cdots f_1^{2j+2t+t_0} \psi_0(b_0) = f_n^{2j+2t+t_0} \cdots f_1^{2j+2t+t_0} \psi_n(b_0)
\]
\[
= f_n^{2j+2t+t_0} \cdots f_2^{2j+2t+t_0} \psi_n(f_1^{2j+2t+t_0} b_0).
\]

Suppose that \( 2t + t_0 > 0 \). Observe that

\[
f_0^{j - (2j+2t+t_0)} \psi_n(b) = \psi_n(f_0^{j - (2j+2t+t_0)} b) \neq 0.
\]

On the other hand,

\[
f_0^{j - (2j+2t+t_0)} \psi_0(b') = f_0^{j - (2j+2t+t_0)} f_n^{2j+2t+t_0} \cdots f_2^{2j+2t+t_0} \psi_n(f_1^{2j+2t+t_0} b_0)
\]
\[
= f_n^{2j+2t+t_0} \cdots f_2^{2j+2t+t_0} f_0^{j - (2j+2t+t_0)} \psi_n(f_1^{2j+2t+t_0} b_0)
\]
\[
= f_n^{2j+2t+t_0} \cdots f_2^{2j+2t+t_0} \psi_n(f_0^{j - (2j+2t+t_0)} f_1^{2j+2t+t_0} b_0)
\]
\[
= 0,
\]

which is a contradiction. Therefore \( 2t + t_0 = 0 \), and hence \( b' = b \).

\[ \square \]
Proof of Theorem 6.10.2. Let b be a highest element of \( \ell' (B^{1, 1}) \). Then by Proposition 6.10.1, \( x_i(b) = 0 \), \( x_i(b) = \bar{x}_i(b) = 0 \) for \( i = 2, \ldots, n - 1 \). Set \( x_1(b) = t_1 \), \( x_n(b) = t_n \), \( \bar{x}_n(b) = \bar{t}_n \), and \( x_0(b) = t_0 \). It is clear that \( t_1 + t_n + t_0 + \bar{t}_n \leq l \) and

\[
\text{wt}(b) = -2t_1 \Lambda_0 + t_1 \Lambda_1 + (\bar{t}_n - t_n) \Lambda_{n-1} + 2(t_n - \bar{t}_n) \Lambda_n.
\]

By the same argument of Lemma 6.10.3, \( \psi_n(b) = \psi_0(b') \) for some highest-weight element \( b' \) of \( \ell''(B^{1, 1}) \) with the same highest weight. Set \( x_1(b') = s_1 \), \( x_n(b') = s_n \), \( \bar{x}_n(b') = \bar{s}_n \), and \( x_0(b') = s_0 \). Then \( s_1 = t_1 \) and \( \bar{s}_n - s_n = \bar{t}_n - t_n \).

Note that \( b' = f_n^{s_2 + s_0} f_{n-1}^{s_n + s_0} \cdots f_1^{s_n + s_0} b_0 \), where \( b_0 = (b_{0,k})_{k=1}^{s(b')} \) is an element of \( B^{1, 1} \) with \( b_{0,k} = 1 \) for all \( k = 1, \ldots, s(b') \). Therefore we have

(6.10.15) \[
\psi_n(b) = \psi_0(b')
\]

\[
= \psi_0(f_n^{s_2 + s_0} f_{n-1}^{s_n + s_0 + \bar{s}_n} \cdots f_1^{s_n + s_0 + \bar{s}_n} b_0)
\]

\[
= f_n^{s_2 + s_0} f_{n-1}^{s_n + s_0 + \bar{s}_n} \cdots f_1^{s_n + s_0 + \bar{s}_n} \psi_0(b_0)
\]

\[
= f_n^{s_2 + s_0} f_{n-1}^{s_n + s_0 + \bar{s}_n} \cdots f_1^{s_n + s_0 + \bar{s}_n} \psi_n(b_0)
\]

\[
= f_n^{s_2 + s_0} f_{n-1}^{s_n + s_0 + \bar{s}_n} \cdots f_1^{s_n + s_0 + \bar{s}_n} \psi_n(f_1^{s_n + s_0 + \bar{s}_n} b_0).
\]

If \( s_n + s_0 + \bar{s}_n > t_n + t_0 + \bar{t}_n \), we have

\[
\int_0^{t_n + s_0 + \bar{s}_n + \bar{t}_n + 1} \psi_n(b) = \psi_n(f_0^{t_n + s_0 + \bar{s}_n + \bar{t}_n + 1} b) \neq 0.
\]

On the other hand,

(6.10.16) \[
\int_0^{t_n + s_0 + \bar{s}_n + \bar{t}_n + 1} \psi_0(b')
\]

\[
= \int_0^{t_n + s_0 + \bar{s}_n + \bar{t}_n + 1} f_n^{2s_2 + s_0} f_{n-1}^{s_n + s_0 + \bar{s}_n} \cdots f_1^{s_n + s_0 + \bar{s}_n} \psi_0(f_1^{s_n + s_0 + \bar{s}_n} b_0)
\]

\[
= f_n^{2s_2 + s_0} f_{n-1}^{s_n + s_0 + \bar{s}_n} \cdots f_1^{s_n + s_0 + \bar{s}_n} \psi_0(f_1^{s_n + s_0 + \bar{s}_n} b_0)
\]

\[
= f_n^{2s_2 + s_0} f_{n-1}^{s_n + s_0 + \bar{s}_n} \cdots f_1^{s_n + s_0 + \bar{s}_n} \psi_0(f_0^{t_n + s_0 + \bar{s}_n + \bar{t}_n + 1} b_0)
\]

\[
= 0,
\]

which is a contradiction.

If \( s_n + s_0 + \bar{s}_n < t_n + t_0 + \bar{t}_n \), we have

\[
\int_0^{t_1 + t_n + t_0 + \bar{t}_n + 1} \psi_n(b) = \psi_n(f_0^{t_1 + t_n + t_0 + \bar{t}_n + 1} b) = 0.
\]
But, since \( \tilde{f}_0 \tilde{f}_1 b_0 = \tilde{f}_1 \tilde{f}_0 b_0 \) for \( 0 \leq s \leq l - s(b_0), 0 \leq t \leq s(b_0) \),

\[
(6.10.17) \quad \int_0^{t_i} \int_0^{t_j} \psi_0(b') = f_1^{s_{n+1}+s_0} f_{n-1}^{s_{n+1}+s_0} \cdots f_1^{s_{n+1}+s_0} \psi_n(b_0) \int_0^{t_i} \int_0^{t_j} \psi_0(b') = f_1^{s_{n+1}+s_0} f_{n-1}^{s_{n+1}+s_0} \cdots f_1^{s_{n+1}+s_0} \psi_n(b_0) \int_0^{t_i} \int_0^{t_j} \psi_0(b') = \int_0^{t_i} \int_0^{t_j} \psi_0(b') \]

where \( b'' = (b''_k)_{k=1}^l \) is a highest-weight element of \( i^*(B^{1,l}) \) such that \( b''_k = 1 \) for all \( k \). Hence (6.10.17) is the same as

\[
(6.10.18) \quad \int_0^{s_{n+1}+s_0} \int_0^{s_{n+1}+s_0} \cdots \int_0^{s_{n+1}+s_0} \psi_n(b'') = \int_0^{s_{n+1}+s_0} \int_0^{s_{n+1}+s_0} \cdots \int_0^{s_{n+1}+s_0} \psi_0(b'') \quad \psi_0(b'') = 0,
\]

which also gives a contradiction.

Therefore, we must have \( s_n + s_0 + \tilde{s}_n = t_n + t_0 + \tilde{t}_n \), which implies \( b = b' \). Thus \( \psi_0 \) and \( \psi_n \) coincide with each other on every highest-weight element of \( i^*(B^{1,l}) \), and hence on every element of \( B^{1,l} \), which completes the proof.

In Section 5 we proved that there exists a finite-dimensional representation \( V \) of \( U_q(D^{(2)}_{n+1}) \) with crystal base \( (L, B) \) such that

\[
i_0^*(B) \cong B(0) \oplus B(\Lambda_1) \oplus \cdots \oplus B(l\Lambda_1)
\]

and

\[
i_n^*(B) \cong B(0) \oplus B(\Lambda_1) \oplus \cdots \oplus B(l\Lambda_1)
\]

as crystals for \( U_q(B_n) \). Therefore by Theorem 6.10.2, there is a unique isomorphism \( B^{1,l} \cong B \) as crystals for \( U_q(D^{(2)}_{n+1}) \). Now, we have completed the proof of Proposition 1.9.1.

**Proposition 6.10.4.** The crystal \( B^{1,l} \otimes B^{1,l} \) is connected.

**Proof.** Since each element is connected to a highest-weight element of \( i_0^*(B^{1,l} \otimes B^{1,l}) \), it suffices to prove that all the highest-weight elements of \( i_0^*(B^{1,l} \otimes B^{1,l}) \) are connected to each other. Let \( b_0 \) be the element of \( B^{1,l} \) given by

\[
x_0(b_0) = 0, \quad x_i(b_0) = 1, \quad \bar{x}_i(b_0) = 0,
\]

\[
x_i(b_0) = \bar{x}_i(b_0) = 0 \quad \text{for} \quad i = 2, \ldots, n.
\]

We will show that all the highest-weight elements of \( i_0^*(B^{1,l} \otimes B^{1,l}) \) are connected to \( b_0 \otimes b_0 \).
By (2.2.17) in [KMN²], the highest-weight elements of $t_\theta(B^{1,1} \otimes B^{1,1})$ are of the form $b_1 \otimes b_2$, where $b_1$ and $b_2$ satisfy

\[
x_1(b_1) = j \quad \text{for some } j = 0, 1, \ldots, l,
\]

\[
x_0(b_1) = 0, \quad \bar{x}_1(b_1) = 0,
\]

\[
x_i(b_1) = \bar{x}_i(b_1) = 0 \quad \text{for } i = 2, \ldots, n,
\]

\[
x_0(b_2) = 0, \quad \bar{x}_2(b_2) = 0,
\]

\[
x_i(b_2) = \bar{x}_i(b_2) = 0 \quad \text{for } i = 3, \ldots, n.
\]

Let $x_1(b_2) = t_1$, $x_2(b_2) = t_2$, and $\bar{x}_1(b_2) = t_1$. Then we have

\[
b_0 \otimes b_0 = f^{j_0 + s(t_1 + 2t_2)} f^{j_1 + s(t_1 + t_2)} \cdots f^{j_{n-1} + s(t_1 + t_2)} f^{j_n + t_1 + t_2} f^{j_n + t_1 + t_2} f^{j_2 + t_1 + t_2} f^{j_1 + t_1 + t_2} (b_1 \otimes b_2),
\]

which completes the proof. \hfill \Box

**Proof of Theorem 1.9.2 and Theorem 1.9.3.** We first show that $\langle c, e(b) \rangle \geq l$ for all $b \in B^{1,1}$. Since $c = h_0 + 2h_1 + \cdots + 2h_{n-1} + h_n$, we have from (6.10.5), (6.10.6), and (6.10.13),

\[(6.10.19) \langle c, e(b) \rangle = l - s(b) + 2(x_1(b) - \bar{x}_1(b))_+ + 2 \sum_{i=1}^{n-1} (\bar{x}_i(b) + (x_{i+1}(b) - \bar{x}_{i+1}(b))_+) + 2\bar{x}_n(b) + x_0(b).
\]

Set $S_0 = \{ j \in J \mid x_j(b) = \bar{x}_j(b) \}$, $S_1 = \{ j \in J \mid x_j(b) > \bar{x}_j(b) \}$, and $S_2 = \{ j \in J \mid x_j(b) < \bar{x}_j(b) \}$. Then (6.10.19) becomes

\[(6.10.20) \quad \langle c, e(b) \rangle = l - s(b) + 2 \sum_{j \in S_0} \bar{x}_j(b) + 2 \sum_{j \in S_1} x_j(b)
\]

\[
+ 2 \sum_{j \in S_2} \bar{x}_j(b) + x_0(b)
\]

\[\geq l - s(b) + \sum_{j \in S_0} (x_j(b) + \bar{x}_j(b)) + \sum_{j \in S_1} (x_j(b) + \bar{x}_j(b))
\]

\[+ \sum_{j \in S_2} (x_j(b) + \bar{x}_j(b)) + x_0(b)
\]

\[= l - s(b) + s(b) = l.
\]
Now let $\Lambda = \sum_{l=0}^{n} k_i \Lambda_i$ be a dominant integral weight of level $l$, i.e.,

$$(6.10.21) \quad \langle \Lambda, c \rangle = k_0 + 2k_1 + \cdots + 2k_{n-1} + k_n = l.$$ 

We will show that there exists a unique element $b \in B^{1,l}$ such that $\varepsilon_i(b) = k_i$ for all $i = 0, \ldots, n$. For existence, we take $b \in B^{1,l}$ with

$$x_0(b) = 0 \quad \text{if } k_n \text{ is even},$$

$$= 1 \quad \text{if } k_n \text{ is odd},$$

$$(6.10.22) \quad x_i(b) = \bar{x}_i(b) = k_i \quad \text{for } i = 1, \ldots, n - 1,$$

$$x_n(b) = \bar{x}_n(b) = \frac{k_n - x_0(b)}{2}.$$ 

Then it is easy to see that

$$\varepsilon_i(b) = \bar{x}_i(b) = k_i \quad \text{for } i = 1, \ldots, n - 1,$$

$$\varepsilon_n(b) = 2\bar{x}_n(b) + x_0(b) = k_n.$$ 

Moreover, we see from (6.10.21) and (6.10.22) that

$$\varepsilon_0(b) = l - s(b) = l - \left( \sum_{i=1}^{n} x_i(b) + \sum_{i=1}^{n} \bar{x}_i(b) + x_0(b) \right)$$

$$= l - \left( 2 \sum_{i=1}^{n-1} k_i + (k_n - x_0(b)) + x_0(b) \right) = l - \left( 2 \sum_{i=1}^{n-1} k_i + k_n \right)$$

$$= k_0.$$ 

For uniqueness, let $b'$ be an element of $B^{1,l}$ such that $\varepsilon_i(b') = k_i$ for all $i = 0, 1, \ldots, n$. Then $\langle c, \varepsilon(b') \rangle = l$. In (6.10.20), the equality holds if and only if $S_1 = S_2 = \phi$, i.e., $x_i(b') = \bar{x}_i(b')$ for all $i = 1, \ldots, n$. Hence

$$\varepsilon_0(b') = l - s(b') = k_0,$$

$$\varepsilon_i(b') = x_i(b') = \bar{x}_i(b') = k_i \quad \text{for } i = 1, \ldots, n - 1,$$

$$\varepsilon_n(b') = 2x_n(b') + x_0(b') = 2\bar{x}_n(b') + x_0(b') = k_n.$$
Thus we have
\[ x_i(b') = \bar{x}_i(b') = k_i \quad \text{for } i = 1, \ldots, n - 1, \]
\[ x_n(b') = \bar{x}_n(b') = \frac{k_n - x_0(b')}{2}, \]
which implies
\[ x_0(b') = 0 \quad \text{if } k_n \text{ is even,} \]
\[ = 1 \quad \text{if } k_n \text{ is odd.} \]

Hence \( b = b' \). Now we have completed the proof of Theorem 1.9.3 and then that of Theorem 1.9.2 by the arguments above, Remark 1.9.4 and Proposition 6.10.4. \( \square \)

**Proposition 6.10.5.** Let \( \Lambda \) and \( b \) be as in the proof of Theorem 1.9.2. Then we have
\[ \Lambda + af(wt(b)) = \Lambda. \]

Thus the ground-state of weight \( \Lambda \) is the sequence \( (b, b, b, b, \ldots) \).

6.11. \((A_n^{(2)}, B(0) \oplus B(\Lambda_1) \oplus \cdots \oplus B(\ell \Lambda_1)) (n \geq 2)\). First, note that the proof of Proposition 1.10.1 is similar to that of Proposition 1.9.1.

We shall use the notations in 1.10. For \( i = 1, \ldots, n \), the rule of drawing the \( i \)-arrow on \( \bar{B} \) is given in [KN]. From that rule, for \( i = 1, \ldots, n - 1 \), we observe that
\[ \epsilon_i(b) = \bar{x}_i(b) + (x_{i+1}(b) - \bar{x}_{i+1}(b))_+, \]
\[ (6.11.1) \]
and
\[ \phi_i(b) = x_i(b) + (\bar{x}_{i+1}(b) - x_{i+1}(b))_+, \]
\[ (6.11.2) \]

Let \( B' = B((l - 2\lfloor l/2 \rfloor)\Lambda_1) \oplus \cdots \oplus B((l - 2)\Lambda_1) \oplus B(l \Lambda_1) \) be the direct sum of crystals with highest weight for \( U_q(B_n) \). Set \( K' = \{1, \ldots, n, 0, \bar{n}, \ldots, \bar{1}\} \) and consider the ordering on \( K' \) given by
\[ 1 < 2 < \cdots < n < 0 < \bar{n} < \cdots < \bar{2} < \bar{1}. \]

Then the elements of \( B' \) are labeled by \( b' = (b'_k)_{k=1}^l \), where \( b'_k \in K' \), \( b'_k \leq b'_{k+1} \) for all \( k \), and \( 0 \leq j \leq l \). Here we write \( b' = \phi \) when \( j = 0 \). Let \( x_0(b') = \# \{ k | b'_k = 0 \} \), \( x_i(b') = \# \{ k | b'_k = i \} \), \( \bar{x}_i(b') = \# \{ k | b'_k = \bar{i} \} \), and let \( s(b') = \sum x_i(b') + x_0(b') + \sum \bar{x}_i(b') \). Note that \( x_0(b') = 0 \) or 1. For \( i = 1, \ldots, n \), the rule of drawing the \( i \)-arrow is given in [KN].
We define a bijection $\sigma: \tilde{B} \rightarrow B'$ as follows. Let $b = (b_k)_{k=1}^n \in B(j \Lambda_1)$. For $i = 1, \ldots, n - 1$, we define

$$x_i(\sigma(b)) = (\bar{x}_{n-i+1}(b) - x_{n-i+1}(b))_+ + \min(x_{n-i}(b), \bar{x}_{n-i}(b)),$$

$$\bar{x}_i(\sigma(b)) = (x_{n-i+1}(b) - \bar{x}_{n-i+1}(b))_+ + \min(x_{n-i}(b), \bar{x}_{n-i}(b)).$$

(6.11.3)

We also define

$$x_0(\sigma(b)) = 0 \quad \text{if } l - s(b) \text{ is even},$$

$$= 1 \quad \text{if } l - s(b) \text{ is odd},$$

(6.11.4)

$$x_n(\sigma(b)) = \left[ \frac{l - s(b)}{2} \right] + (\bar{x}_1(b) - x_1(b))_+,$$

$$\bar{x}_n(\sigma(b)) = \left[ \frac{l - s(b)}{2} \right] + (x_1(b) - \bar{x}_1(b))_+.$$  

(6.11.5)

Note that $s(\sigma(b)) = l - t(b)$, where $t(b) = 2 \min(x_n(b), \bar{x}_n(b))$. Hence $\sigma(b) \in B'$.

We define a map $\tau: B' \rightarrow \tilde{B}$ in the same principle. More precisely, for $i = 1, \ldots, n - 1$, we define

$$x_i(\tau(b')) = (\bar{x}_{n-i+1}(b') - x_{n-i+1}(b'))_+ + \min(x_{n-i}(b'), \bar{x}_{n-i}(b')),$$

$$\bar{x}_i(\tau(b')) = (x_{n-i+1}(b') - \bar{x}_{n-i+1}(b'))_+ + \min(x_{n-i}(b'), \bar{x}_{n-i}(b')),$$

(6.11.6)

and

$$x_n(\tau(b')) = \left[ \frac{l - s(b')}{2} \right] + (\bar{x}_1(b') - x_1(b'))_+,$$

$$\bar{x}_n(\tau(b')) = \left[ \frac{l - s(b')}{2} \right] + (x_1(b') - \bar{x}_1(b'))_+.$$  

(6.11.7)

It is straightforward to see that $\tau \sigma = id_{\tilde{B}}$ and $\sigma \tau = id_{B'}$.

Now we define the rule of the 0-arrow by

$$\tilde{f}_0(b) = \tau \tilde{f}_0 \sigma(b).$$

(6.11.8)

That is, $b \rightarrow b'$ if and only if $\sigma(b) \nrightarrow \sigma(b')$. Then we have

$$\tilde{e}_0(b) = l - s(b) + 2(x_1(b) - \bar{x}_1(b))_+,$$

$$\tilde{q}_0(b) = l - s(b) + 2(\bar{x}_1(b) - x_1(b))_+.$$  

(6.11.9)
Now let us denote by $B^{1,1}$ the crystal $\tilde{B}$ endowed with 0-arrows defined as above.

**Proposition 6.11.1.** Let $J' = \{1, \ldots, n - 1\}$ be the index set for the simple roots for $U_q(\mathfrak{sl}(n))$ and define a map $\iota': J' \to I$ by $\iota'(j) = j$ for $j \in J'$. Then $\iota'^*(B^{1,1})$ splits into a direct sum of crystals for $U_q(\mathfrak{sl}(n))$ with highest weight

$$-2 \alpha_1 \Lambda_0 + t_1 \Lambda_1 + (\tilde{t}_n - t_n) \Lambda_{n-1} + (t_n - \tilde{t}_n) \Lambda_n,$$

where $t_1, t_n, \tilde{t}_n$ are nonnegative integers such that $t_n \leq \tilde{t}_n, t_1 + t_n + \tilde{t}_n \leq l$.

**Proof.** It is similar to Proposition 6.10.1. \qed

**Proof of Proposition 1.10.1.** Now we have the uniqueness of $B^{1,1}$.

**Theorem 6.11.2.** Let $B$ be a crystal for $U_q(A_{2n}^{(2)})$ such that

$$\iota_f^*(B) \cong B(0) \oplus B(\Lambda_1) \oplus \cdots \oplus B(l \Lambda_1)$$

as crystals for $U_q(C_n)$ and

$$\iota_n^*(B) \cong B\left(l - 2 \left[\begin{array}{c} l \\ 2 \end{array}\right] \Lambda_1\right) \oplus \cdots \oplus B((l - 2) \Lambda_1) \oplus B(l \Lambda_1)$$

as crystals for $U_q(B_n)$. Then there exists a unique isomorphism $\psi: B^{1,1} \to B$ as crystals for $U_q(A_{2n}^{(2)})$.

**Proof.** It is similar to Theorem 6.10.2. \qed

In Section 5 we proved that there exists a finite-dimensional representation $V$ of $U_q(A_{2n}^{(2)})$ with crystal base $(L, B)$ such that

$$\iota_f^*(B) \cong B(0) \oplus B(\Lambda_1) \oplus \cdots \oplus B(l \Lambda_1)$$

as crystals for $U_q(C_n)$ and

$$\iota_n^*(B) \cong B\left(l - 2 \left[\begin{array}{c} l \\ 2 \end{array}\right] \Lambda_1\right) \oplus \cdots \oplus B((l - 2) \Lambda_1) \oplus B(l \Lambda_1)$$

as crystals for $U_q(B_n)$. Therefore by Theorem 6.11.2, there is a unique isomorphism $B^{1,1} \cong B$ as crystals for $U_q(A_{2n}^{(2)})$. Now we have completed the proof of Proposition 1.10.1. \qed

**Proposition 6.11.3.** The crystal $B^{1,1} \otimes B^{1,1}$ is connected.

**Proof.** It is similar to Proposition 6.10.4. \qed

**Proof of Theorem 1.10.2 and Theorem 1.10.3.** We first show that $\langle e, e(b) \rangle \geq l$ for all $b \in B^{1,1}$. Since $c = h_0 + 2h_1 + \cdots + 2h_{n-1} + 2h_n$, we have from (6.11.1),
(6.11.2), and (6.11.9),

\begin{equation}
\langle c, \varepsilon(b) \rangle = l - s(b) + 2(x_i(b) - \bar{x}_i(b))_+ \nonumber \\
+ 2 \sum_{i=1}^{n-1} (\bar{x}_i(b) + (x_{i+1}(b) - \bar{x}_{i+1}(b))_+) + 2\bar{x}_n(b).
\end{equation}

Set \( S_0 = \{ j \in J \mid x_j(b) = \bar{x}_j(b) \} \), \( S_1 = \{ j \in J \mid x_j(b) > \bar{x}_j(b) \} \), and \( S_2 = \{ j \in J \mid x_j(b) < \bar{x}_j(b) \} \). Then by (6.11.10) we have

\begin{equation}
\langle c, \varepsilon(b) \rangle = l - s(b) + 2 \sum_{j \in S_0} \bar{x}_j(b) + 2 \sum_{j \in S_1} x_j(b) + 2 \sum_{j \in S_2} \bar{x}_j(b) \nonumber \\
\geq l - s(b) + \sum_{j \in S_0} (x_j(b) + \bar{x}_j(b)) \nonumber \\
+ \sum_{j \in S_1} (x_j(b) + \bar{x}_j(b)) + \sum_{j \in S_2} (x_j(b) + \bar{x}_j(b)) \nonumber \\
= l - s(b) + s(b) = l.
\end{equation}

Now let \( \Lambda = \sum_{i=0}^{n} k_i \Lambda_i \) be a dominant integral weight of level \( l \), i.e.,

\begin{equation}
\langle \Lambda, c \rangle = k_0 + 2k_1 + \cdots + 2k_{n-1} + 2k_n = l.
\end{equation}

We will show that there exists a unique element \( b \in B^{1,l} \) such that \( \varepsilon_i(b) = k_i \) for all \( i = 0, \ldots, n \). For existence, we take \( b \in B^{1,l} \) with

\begin{equation}
x_i(b) = \bar{x}_i(b) = k_i \quad \text{for } i = 1, \ldots, n.
\end{equation}

Then it is easy to see that

\[ \varepsilon_i(b) = \bar{x}_i(b) = k_i \quad \text{for } i = 1, \ldots, n. \]

Moreover, we see from (6.11.12) and (6.11.13) that

\[ \varepsilon_0(b) = l - s(b) = l - \left( \sum_{i=1}^{n} x_i(b) + \sum_{i=1}^{n} \bar{x}_i(b) \right) \nonumber \\
= l - 2 \sum_{i=1}^{n} k_i = k_0. \]

The proof of uniqueness is similar to the argument in the proof of Theorem 1.9.2. Hence, we have completed the proof of Theorem 1.10.3 and then that of Theorem 1.10.2 by the arguments above, Remark 1.10.4, and Proposition 6.11.3.
Proposition 6.11.4. Let $\Lambda$ and $b$ be as in the proof of Theorem 1.10.2. Then we have

$$\Lambda + af(wt(b)) = \Lambda.$$ 

Thus the ground-state path of weight $\Lambda$ is the sequence $(b, b, b, \ldots)$.
