

Periodic solutions of Boussinesq equations

MORIMOTO, Hiroko (森本浩子) *

Let Ω be a bounded domain in R^2 with the boundary $\partial\Omega$ such that

$$\partial\Omega = \Gamma_1 \cup \Gamma_2, \quad \Gamma_1 \cap \Gamma_2 = \phi.$$

We consider the following initial boundary value problem:

$$\begin{cases} \frac{\partial u}{\partial t} + (u \cdot \nabla)u = -\frac{1}{\rho}\nabla p + \nu\Delta u + \beta g\theta \\ \operatorname{div} u = 0, \\ \frac{\partial \theta}{\partial t} + (u \cdot \nabla)\theta = \chi\Delta\theta, \end{cases} \quad x \in \Omega, t > 0, \quad (1)$$

$$\begin{cases} u(x, t) = 0, \quad \theta(x, t) = \xi(x, t), & x \in \Gamma_1, t > 0, \\ u(x, t) = 0, \quad \frac{\partial}{\partial n}\theta(x, t) = \eta(x, t), & x \in \Gamma_2, t > 0, \end{cases} \quad (2)$$

$$\begin{cases} u(x, 0) = a_0(x), \\ \theta(x, 0) = \tau_0(x), \end{cases} \quad x \in \Omega, \quad (3)$$

where $u = (u_1, u_2)$ is the fluid velocity, p is the pressure, θ is the temperature, $u \cdot \nabla = \sum_{j=1}^2 u_j \frac{\partial}{\partial x_j}$, $\frac{\partial \theta}{\partial n}$ denotes the outer normal derivative of θ at x to $\partial\Omega$, $g(x, t)$ is the gravitational vector function, and ρ (density), ν (kinematic viscosity), β (coefficient of volume expansion), χ (thermal diffusivity) are positive constants. $\xi(x, t)$ (resp. $\eta(x, t)$) is a function defined on $\Gamma_1 \times (0, T)$ (resp. $\Gamma_2 \times (0, T)$) and $a_0(x)$ (resp. $\tau_0(x)$) is a vector (resp. scalar) function defined on Ω .

*School of Science and Technology, Meiji University

In order to state our results, we introduce some **Function spaces** ([1],[2],[3]).

$L^p(\Omega)$ and the Sobolev space $W_p^\ell(\Omega)$ are defined as usual. We also denote $\mathbf{L}^p(\Omega) = L^p(\Omega) \times L^p(\Omega)$, $H^\ell(\Omega) = W_2^\ell(\Omega)$. Whether the elements of the space are scalar or vector functions is understood from the contexts unless stated explicitly.

$$D_\sigma = \{\text{vector function } \varphi \in C^\infty(\Omega) \mid \text{supp}\varphi \subset \Omega, \text{div}\varphi = 0 \text{ in } \Omega\},$$

$$H = \text{completion of } D_\sigma \text{ under the } L^2(\Omega)\text{-norm,}$$

$$V = \text{completion of } D_\sigma \text{ under the } H^1(\Omega)\text{-norm,}$$

$$D_0 = \{\text{scalar function } \varphi \in C^\infty(\bar{\Omega}) \mid \varphi \equiv 0 \text{ in a neighborhood of } \Gamma_1\},$$

$$W = \text{completion of } D_0 \text{ under the } H^1(\Omega)\text{-norm,}$$

$$V', W' \text{ are dual space of } V, W.$$

Definition 1

$\{u, \theta\}$ is called a weak solution of evolutionary problem (1),(2) if, for some function θ_0 such that

$$\theta_0 \in L^2(0, T : H^1(\Omega)), \quad \theta_0 = \xi \text{ on } \Gamma_1,$$

$\{u, \theta\}$ satisfies following conditions:

$$u \in L^2(0, T : V), \quad \theta - \theta_0 \in L^2(0, T : W),$$

$$\begin{cases} \frac{d}{dt}(u, v) + \nu(\nabla u, \nabla v) + ((u \cdot \nabla)u, v) - (\beta g \theta, v) = 0, & \forall v \in V, \\ \frac{d}{dt}(\theta, \tau) + \chi(\nabla \theta, \nabla \tau) + ((u \cdot \nabla)\theta, \tau) - \chi(\eta, \tau)_{\Gamma_2} = 0, & \forall \tau \in W, \end{cases} \quad (4)$$

where

$$(\eta, \tau)_{\Gamma_2} = \int_{\Gamma_2} \eta(x') \tau(x') d\sigma.$$

As for the smoothness of $\partial\Omega$, we suppose

Condition (H)

$\partial\Omega$ is of class C^1 and divided as follows:

$$\partial\Omega = \Gamma_1 \cup \Gamma_2, \quad \Gamma_1 \cap \Gamma_2 = \phi, \quad \text{measure of } \Gamma_1 \neq 0,$$

and the intersection $\bar{\Gamma}_1 \cap \bar{\Gamma}_2$ consists of finite points.

In [3], we showed the existence and the uniqueness of weak solution of evolutionary problem for $2 \leq n \leq 4$. For $n = 2$, we have the following result:

Theorem A

Let Ω be a bounded domain in R^2 with C^1 boundary satisfying Condition(H). If the function g is in $L^\infty(\Omega \times (0, T))$, $\xi \in C^1(\bar{\Gamma}_1 \times [0, T])$, $\eta \in L^2(\Gamma_2 \times (0, T))$, $a_0 \in H$, $\tau_0 \in L^2(\Omega)$, then there exists one and only one weak solution $\{u, \theta\}$ of (1), (2) satisfying the initial condition (3). Furthermore

$$u \in C([0, T] : H), \quad \theta \in C([0, T] : L^2(\Omega)).$$

Definition 2

$\{u, \theta\}$ is called a periodic weak solution of (1), (2) with period T_0 , if $\{u, \theta\}$ is a weak solution of (1), (2) for $T = T_0$ satisfying

$$u(x, T_0) = u(x, 0), \quad \theta(x, T_0) = \theta(x, 0). \quad (5)$$

We also obtained the existence of periodic weak solutions([3]).

Theorem B

Let Ω be a bounded domain in R^2 with C^1 boundary satisfying Condition (H). Let $g(x, t)$, $\xi(x, t)$, $\eta(x, t)$ be periodic with respect to t with period T_0 , satisfying $g \in L^\infty(\Omega \times (0, T_0))$, $\xi \in C^1(\bar{\Gamma}_1 \times [0, T_0])$ and $\eta \in L^2(\Gamma_2 \times (0, T_0))$.

Set $g_\infty = \|g\|_{L^\infty(\Omega \times (0, T_0))}$. If $\frac{\beta g_\infty}{\sqrt{\nu\chi}}$ is sufficiently small, then there exists a periodic weak solution of (1), (2) with period T_0 . Furthermore

$$u \in C([0, \infty) : H), \quad \theta \in C([0, \infty) : L^2(\Omega)).$$

Now we can state our results. As for the uniqueness of periodic weak solutions, we obtained:

Theorem 1

Let $\{u_\pi, \theta_\pi\}$ be a weak periodic solution of (1), (2) with period T_0 such that for some $p > 2$,

$$\text{ess.sup}_t \left\{ c \|u_\pi(t)\|_p + \frac{1}{4\chi} (c \|\theta_\pi(t)\|_p + c' \beta g_\infty)^2 \right\} < \nu, \quad (6)$$

where c and c' are constants depending on Ω . If $\{u_\pi + u, \theta_\pi + \theta\}$ is a weak periodic solution of (1), (2) with period T_0 , then $u = 0, \theta = 0$.

Let $g \in L^\infty(\Omega \times (0, \infty))$, $\xi \in C^1(\bar{\Gamma}_1 \times [0, \infty))$, $\eta \in L^2(\Gamma_2 \times (0, \infty))$, $a_0 \in H, \tau_0 \in L^2(\Omega)$. Let T be any positive number. Then there exists one and only one weak solution $\{u_T, \theta_T\}$ of (1), (2) satisfying (3). Therefore, for $T < T'$,

$$u_T(t) = u_{T'}(t), \quad \theta_T(t) = \theta_{T'}(t) \quad \text{for } \forall t \in (0, T)$$

hold, and we can omit T . This solution is called a global weak solution. We obtained the asymptotic property of solutions of Boussinesq equations as follows.

Theorem 2

Let g, ξ, η satisfy the condition of Theorem B, $a_0 \in H, \tau_0 \in L^2(\Omega)$. Let $\{u, \theta\}$ be a global weak solution of (1), (2) satisfying (3), $\{u_\pi, \theta_\pi\}$ a periodic weak solution satisfying (6). Then

$$\lim_{t \rightarrow \infty} \{ \|u(t) - u_\pi(t)\|^2 + \|\theta(t) - \theta_\pi(t)\|^2 \} = 0.$$

Remark

(i) Since $u_\pi \in L^2(0, T : V) \cap C([0, T] : H)$, u_π belongs to the space $L^{2p/(p-2)}(0, T : L^p(\Omega))$ for $\forall p > 2$. Similarly θ_π is in $L^{2p/(p-2)}(0, T : L^p(\Omega))$.

The condition (6) is stronger than this one.

(ii) When (6) holds, such periodic solution is unique (Theorem 1).
