Drapeau Theorem for Differential Systems

北海道大学大学院理学研究科 渋谷 一博 (Kazuhiro Shibuya)
Department of Mathematics, Hokkaido University

1. INTRODUCTION

This talk is concerned with the Drapeau theorem for differential systems. By a differential system \((R, D)\), we mean a distribution \(D\) on a manifold \(R\), i.e., \(D\) is a subbundle of the tangent bundle \(T(R)\). The derived system \(\partial D\) of \(D\) is defined, in terms of sections, by

\[
\partial D = D + [D, D].
\]

where \(D = \Gamma(D)\) denotes the space of sections of \(D\). In general \(\partial D\) is obtained as a subsheaf of the tangent sheaf of \(R\) (for the precise argument, see e.g.\([Y1], [BCG3]\)). Moreover higher derived systems \(\partial^k D\) are defined successively by

\[
\partial^k D = \partial(\partial^{k-1} D),
\]

where we put \(\partial^0 D = D\) by convention. In this talk, a differential system \((R, D)\) is called regular if \(\partial^i D\) are subbundles of \(T(M)\) for every \(i \geq 1\).

We say that \((R, D)\) is an \(m\)-flag of length \(k\), if \((R, D)\) is regular and has a derived length \(k\), i.e., \(\partial^k D = T(R)\);

\[
D \subset \partial D \subset \cdots \subset \partial^{k-2} D \subset \partial^{k-1} D \subset \partial^k D = T(R),
\]

such that \(\text{rank } D = m + 1\) and \(\text{rank } \partial^i D = \text{rank } \partial^{i-1} D + m\) for \(i = 1, \ldots, k\). In particular \(\dim R = (k + 1)m + 1\).

Especially \((R, D)\) is called a Goursat flag (un drapeau de Goursat) of length \(k\) when \(m = 1\). Historically, by Engel, Goursat and Cartan, it is known that a Goursat flag \((R, D)\) of length \(k\) is locally isomorphic, at a generic point, to the canonical system \((J^k(M, 1), C^k)\) on the \(k\)-jet spaces of 1 independent and 1 dependent variable (for the definition of the canonical system \((J^k(M, 1), C^k)\), see §2). The characterization of the canonical (contact) systems on jet spaces was given by R. Bryant in \([B]\) for the first order systems and in \([Y1]\) and \([Y2]\) for higher order systems for \(n\) independent and \(m\) dependent variables. However, it was first explicitly exhibited by A.Giaro, A. Kumpera and C. Ruiz in \([GKR]\) that a Goursat flag of length 3 has singularities and the research of singularities of Goursat flags of length \(k\) \((k \geq 3)\) began as in \([M1]\). To this situation, R. Montgomery and M. Zhitomirskii constructed the “Monster Goursat manifold” by successive applications of the “Cartan prolongation of rank 2 distributions \([BH]\)” to a surface and showed that every germ of a Goursat flag \((R, D)\) of length \(k\) appears in this “Monster Goursat manifold” in \([MZ]\).
by first exhibiting the following Sandwich Lemma for \((R, D)\);

\[
D \subset \partial D \subset \cdots \subset \partial^{k-2}D \subset \partial^{k-1}D \subset \partial^{k}D = T(R)
\]

where \(\text{Ch}(\partial D)\) is the Cauchy characteristic system of \(\partial D\) and \(\text{Ch}(\partial D)\) is a subbundle of \(\partial^{i-1}D\) of corank 1 for \(i = 1, \ldots, k - 1\). Here the Cauchy Characteristic System \(\text{Ch}(C)\) of a differential system \((R, C)\) is defined by

\[
\text{Ch}(C)(x) = \{X \in C(x) \mid X|d\omega_i \equiv 0 \pmod{\omega_1, \ldots, \omega_s} \text{ for } i = 1, \ldots, s\},
\]

where \(C = \{\omega_1 = \cdots = \omega_s = 0\}\) is defined locally by defining 1-forms \(\{\omega_1, \ldots, \omega_s\}\). Moreover, after [MZ], P. Mormul defined the notion of a special \(m\)-flag of length \(k\) for \(m \geq 2\) to characterize those \(m\)-flags which are obtained by successive applications of the “generalized Cartan prolongation” to the space of 1-jets of 1 independent and \(m\) dependent variables.

The main purpose of this talk is first to clarify the procedure of “Rank 1 Prolongation” of an arbitrary differential system \((R, D)\) of rank \(m + 1\), and to give good criteria for an \(m\)-flag of length \(k\) to be special, i.e., to be locally isomorphic to the \(k\)-th Rank 1 Prolongation \((P^k(M), C^k)\) of a manifold \(M\) of dimension \(m + 1\). More precisely we will show for an \(m\)-flag of length \(k\) for \(m \geq 3\); Corollary 5.8.

Moreover we will show for an \(m\)-flag of length \(k\) for \(m \geq 2\); Corollary 6.3.

For this purpose, we will first review the geometric construction of jet spaces in §2 and clarify the procedure of Rank 1 Prolongation in §3. In §4, we will analyze the notion of a special \(m\)-flag of length \(k\) and reestablish the local characterization of \((P^k(M), C^k)\) by utilizing the Realization Lemma [Y1]. In §5 and §6, we will introduce the main theorem (the Drapeau Theorem) for an \(m\)-flag of length \(k\).

### 2. Geometric Construction of Jet Spaces

In this section, we will briefly recall the geometric construction of jet bundles in general, following [Y1] and [Y2], which is our basis for the later considerations.

Let \(M\) be a manifold of dimension \(m + n\). Fixing the number \(n\), we form the space of \(n\)-dimensional contact elements to \(M\), i.e., the Grassmann bundle \(J(M, n)\) over \(M\) consisting of \(n\)-dimensional subspaces of tangent spaces to \(M\). Namely, \(J(M, n)\) is defined by

\[
J(M, n) = \bigcup_{z \in M} J_z, \quad J_z = \text{Gr}(T_z(M), n),
\]

where \(\text{Gr}(T_z(M), n)\) denotes the Grassmann manifold of \(n\)-dimensional subspaces in \(T_z(M)\). Let \(\pi : J(M, n) \to M\) be the bundle projection. The canonical system \(C\) on \(J(M, n)\) is, by definition, the differential system of codimension \(m\) on \(J(M, n)\) defined by

\[
C(u) = \pi^{-1}_*(u) = \{v \in Tu(J(M, n)) \mid \pi_*(v) \in u\} \subset Tu(J(M, n)) \xrightarrow{\pi} T_z(M),
\]
where \( \pi(u) = x \) for \( u \in J(M, n) \).

Let us describe \( C \) in terms of a canonical coordinate system in \( J(M, n) \). Let \( u_0 \in J(M, n) \). Let \((x_1, \ldots, x_n, z^1, \ldots, z^m)\) be a coordinate system on a neighborhood \( U' \) of \( x_0 = \pi(u_0) \) such that \( dx_1, \ldots, dx_n \) are linearly independent when restricted to \( u_0 \subset T_{x_0}(M) \). We put \( U = \{ u \in \pi^{-1}(U') | dx_1|_u, \ldots, dx_n|_u \ \text{are linearly independent} \} \). Then \( U \) is a neighborhood of \( u_0 \) in \( J(M, n) \). Here \( dx^\alpha|_u \) is a linear combination of \( dx_i|_u \)'s, i.e., \( dx^\alpha|_u = \sum_{i=1}^m p_i^\alpha(u)dx_i|_u \). Thus, there exist unique functions \( p_i^\alpha \) on \( U \) such that \( C \) is defined on \( U \) by the following 1-forms;

\[
\omega^\alpha = dx^\alpha - \sum_{i=1}^n p_i^\alpha dx_i \quad (\alpha = 1, \ldots, m),
\]

where we identify \( x^\alpha \) and \( x_i \) on \( U' \) with their lifts on \( U \). The system of functions \((x_i, z^\alpha, p_i^\alpha) \ (\alpha = 1, \ldots, m, i = 1, \ldots, n) \) on \( U \) is called a canonical coordinate system of \( J(M, n) \) subordinate to \((x_i, z^\alpha)\).

\( (J(M, n), C) \) is the (geometric) 1-jet space and especially, in case \( m = 1 \), is the so-called contact manifold. Let \( M, \hat{M} \) be manifolds of dimension \( m + n \) and \( \varphi : M \to \hat{M} \) be a diffeomorphism. Then \( \varphi \) induces the isomorphism \( \varphi_* : (J(M, n), C) \to (J(\hat{M}, n), \hat{C}) \), i.e., the differential map \( \varphi_* : J(M, n) \to J(\hat{M}, n) \) is a diffeomorphism sending \( C \) onto \( \hat{C} \). The reason why the case \( m = 1 \) is special is explained by the following theorem of Bäcklund.

**Theorem (Bäcklund)** Let \( M \) and \( \hat{M} \) be manifolds of dimension \( m + n \). Assume \( m \geq 2 \). Then, for an isomorphism \( \Phi : (J(M, n), C) \to (J(\hat{M}, n), \hat{C}) \), there exists a diffeomorphism \( \varphi : M \to \hat{M} \) such that \( \Phi = \varphi_* \).

The essential part of this theorem is to show that \( F = \text{Ker} \pi_* \) is the covariant system of \((J(M, n), C)\) for \( m \geq 2 \). Namely an isomorphism \( \Phi \) sends \( F \) onto \( \hat{F} = \text{Ker} \hat{\pi}_* \) for \( m \geq 2 \). For the proof, we refer the reader to Theorem 1.4 in [Y2].

In case \( m = 1 \), it is a well known fact that the group of isomorphisms of \((J(M, n), C)\), i.e., the group of contact transformations, is larger than the group of diffeomorphisms of \( M \). Therefore, when we consider the geometric 2-jet spaces, the situation differs according to whether the number \( m \) of dependent variables is 1 or greater.

1. Case \( m = 1 \). We should start from a contact manifold \((J, C)\) of dimension \( 2n + 1 \), which is locally a space of 1-jet for one dependent variable by Darboux's theorem. Then we can construct the geometric second order jet space \((L(J), E)\) as follows: We consider the Lagrange-Grassmann bundle \( L(J) \) over \( J \) consisting of all \( n \)-dimensional integral elements of \((J, C)\);

\[
L(J) = \bigcup_{u \in J} L_u \subset J(J, n),
\]

where \( L_u \) is the Grassmann manifolds of all Lagrangian (or Legendrian) subspaces of the symplectic vector space \((C(u), d\omega)\). Here \( \omega \) is a local contact form on \( J \). Namely, \( v \in J(J, n) \) is an integral element if and only if \( v \in C(u) \) and \( d\omega|_v = 0 \),
where $u = \pi(v)$. Let $\pi : L(J) \to J$ be the projection. Then the canonical system $E$ on $L(J)$ is defined by

$$E(v) = \pi^{-1}_*(v) \subset T_v(L(J)) \xrightarrow{\pi_*} T_u(J),$$

where $\pi(v) = u$ for $v \in L(J)$. We have $\partial E = \pi_*^{-1}(C)$ and $\text{Ch}(C) = \{0\}$ (cf.[Y1]). Hence we get $\text{Ch}(\partial E) = \text{Ker} \pi_*$, which implies the Bäcklund theorem for $(L(J), E)$ (cf. [Y1]).

Now we put

$$(J^2(M,n), C^2) = (L(J(M,n)), E),$$

where $M$ is a manifold of dimension $n + 1$.

(2) Case $m \geq 2$. Since $F = \text{Ker} \pi_*$ is a covariant system of $(J(M,n), C)$, we define $J^2(M,n) \subset J(J(M,n), n)$ by

$$J^2(M,n) = \{ \text{n-dim. integral elements of } (J(M,n), C), \text{ transversal to } F \}.$$

$C^2$ is defined as the restriction to $J^2(M,n)$ of the canonical system on $J(J(M,n), n)$.

Now the higher order (geometric) jet spaces $(J^{k+1}(M,n), C^{k+1})$ for $k \geq 2$ are defined (simultaneously for all $m$) by induction on $k$. Namely, for $k \geq 2$, we define $J^{k+1}(M,n) \subset J(J^k(M,n), n)$ and $C^{k+1}$ inductively as follows:

$J^{k+1}(M,n) = \{ \text{n-dim. integral elements of } (J^k(M,n), C^k), \text{ transversal to } \text{Ker} (\pi_{k-1}^{k})_* \},$

where $\pi_{k-1}^k : J^k(M,n) \to J^{k-1}(M,n)$ is the projection. Here we have

$$\text{Ker} (\pi_{k-1}^k)_* = \text{Ch}(\partial C^k),$$

and $C^{k+1}$ is defined as the restriction to $J^{k+1}(M,n)$ of the canonical system on $J(J^k(M,n), n)$. Then we have ([Y1],[Y2])

$C^k \subset \cdots \subset \partial^{k-2}C^k \subset \partial^{k-1}C^k \subset \partial^k C^k = T(J^k(M,n))$

$$\cup \bigcup \bigcup$$

$\{0\} = \text{Ch}(C^k) \subset \text{Ch}(\partial C^k) \subset \cdots \subset \text{Ch}(\partial^{k-1}C^k) \subset \text{Ch}(\partial^k C^k) \subset F$

where $\text{Ch}(\partial^{i+1}C^k)$ is a subbundle of $\partial^i C^k$ of corank $n$ for $i = 0, \ldots, k-2$ and, when $m \geq 2$, $F$ is a subbundle of $\partial^{k-1}C^k$ of corank $n$. The transversality conditions are expressed as

$$C^k \cap F = \text{Ch}(\partial C^k) \quad \text{for } m \geq 2,$$

$$C^k \cap \text{Ch}(\partial^{k-1}C^k) = \text{Ch}(\partial C^k) \quad \text{for } m = 1.$$

By the above diagram together with the rank condition, Jet spaces $(J^k(M,n), C^k)$ can be characterized as higher order contact manifolds as in [Y1] and [Y2].

Here we observe that, if we drop the transversality condition in our definition of $J^k(M,n)$ and collect all $n$-dimensional integral elements, we may have some singularities in $J^k(M,n)$ in general. However, since every 2-form vanishes on 1-dimensional subspaces, in case $n = 1$, the integrability condition for $v \in J(J^{k-1}(M,1), 1)$ reduces to $v \subset C^{k-1}(u)$ for $u = \pi_{k-1}^k(v)$. Hence, in this case, we can safely drop
the transversality condition in the above construction as in the next section, which constitutes the key construction for the Drapeau theorem in later considerations.

3. RANK 1 PROLONGATION

Let \((R, D)\) be a differential system, i.e., \(R\) is a manifold of dimension \(s + m + 1\) and \(D\) is a subbundle of \(T(R)\) of rank \(m + 1\). Starting from \((R, D)\), we define \((P(R), \hat{D})\) as follows (cf. [BH]):

\[
P(R) = \bigcup_{x \in R} P_x \subset J(R, 1),
\]

where

\[
P_x = \{1\text{-dim. integral elements of } (R, D) \mid \{u \subset D(x) \mid 1\text{-dim. subspaces} \rightleftharpoons \mathbb{P}^m.
\]

Let \(p : P(R) \rightarrow R\) be the projection. We define the canonical system \(\hat{D}\) on \(P(R)\) by

\[
\hat{D}(u) = p_{*}^{-1}(u) = \{v \in T_u(P(R)) \mid p_{*}(v) \in u\} \subset T_u(P(R)) \rightarrow T_x(R),
\]

where \(p(u) = x\) for \(u \in P(R)\).

We call \((P(R), \hat{D})\) the prolongation of rank 1 (or Rank 1 Prolongation for short) of \((R, D)\). Then \(P(R)\) is a manifold of dimension \(2m + s + 1\) and \(\hat{D}\) is a differential system of rank \(m + 1\). In case \((R, D) = (M, T(M))\), we have \((P(M), \hat{D}) = (J(M, 1), C)\). Moreover

\[
J^2(M, 1) \subset P(J(M, 1)) \subset J(J(M, 1), 1)
\]

As for the prolongation of rank 1, we have

**Proposition 3.1.** Let \((R, D)\) be a differential system of rank \(m + 1\) and let \((P(R), \hat{D})\) be the prolongation of rank 1 of \((R, D)\). Then \(\hat{D}\) is of rank \(m + 1\), \(\partial \hat{D} = p_{*}^{-1}(D)\) and \(\text{Ch}(\hat{D})\) is trivial. Moreover, if \(\text{Ch}(D)\) is trivial, then \(\text{Ch}(\partial \hat{D})\) is a subbundle of \(\hat{D}\) of corank 1.

This proposition implies that, starting from any differential system \((R, D)\), we can repeat the procedure of Rank 1 Prolongation. Let \((P^1(R), D^1)\) be the prolongation of rank 1 of \((R, D)\). Then \((P^k(R), D^k)\) is defined inductively as the prolongation of rank 1 of \((P^{k-1}(R), D^{k-1})\), which is called \(k\)-th prolongation of rank 1 of \((R, D)\). Moreover, starting from a manifold \(M\) of dimension \(m + 1\), we put

\[
(P^k(M), C^k) = (P(P^{k-1}(M)), \hat{C}^{k-1})
\]

where \((P^1(M), C^1) = (J(M, 1), C)\). When \(m = 1\), \((P^k(M), C^k)\) are called "monster Goursat manifolds" in [MZ].

Here we observe that the above proposition also implies

**Proposition 3.2.** Let \((R, D)\) be an \(m\)-flag of length 1, i.e., \(\dim R = 2m + 1\), rank \(D = m + 1\) and \(\partial D = T(R)\). Then the \(k\)-th prolongation \((P^k(R), D^k)\) of rank 1 of \((R, D)\) is an \(m\)-flag of length \(k + 1\). Namely, \(D^k\) satisfies rank \(D^k = m + 1\), rank \(\partial^{i+1}D^k = \text{rank} \partial^{i}D^k + m\) for \(i = 0, \ldots, k\) and \(\partial^{k+1}D^k = T(P^k(R))\).
Schematically we have the following diagram;

\[
\begin{align*}
D^k & \subset \partial D^k \subset \cdots \subset \partial^{k-1} D^k \subset \partial^k D^k \subset \partial^{k+1} D^k = T(P^k(R)) \\
\downarrow p_k^\ast & \quad \downarrow p_k^\ast & \quad \downarrow p_k^\ast \\
D^{k-1} & \subset \cdots \subset \partial^{k-2} D^{k-1} \subset \partial^{k-1} D^{k-1} \subset \partial^k D^{k-1} = T(P^{k-1}(R)) \\
\downarrow p_{k-1}^\ast & \quad \downarrow p_{k-1}^\ast & \quad \downarrow p_{k-1}^\ast \\
\vdots & \quad \vdots & \quad \vdots \\
D^1 & \subset \partial D^1 \subset \partial^2 D^1 = T(P^1(R)) \\
\downarrow p_1^\ast & \quad \downarrow p_1^\ast \\
D & \subset \partial D = T(R)
\end{align*}
\]

where \( p^i : P^i(R) \to P^{i-1}(R) \) is the projection. Here we note

\[ \partial^k D^k = (p_0^k)^{-1}(D), \]

where \( p_0^k : P^k(R) \to R \) is the projection.

4. Special \( m \)-Flags of Length \( k \)

An \( m \)-flag \((R, D)(m \geq 2)\) of length \( k \) is called a special \( m \)-flag if there exists a completely integrable subbundle \( F \) of \( \partial^{k-1} D \) of corank 1, which contains \( \text{Ch}(\partial^{k-1} D) \), and \( \text{Ch}(\partial D) \) is a subbundle of \( \partial^{i-1} D \) of corank 1 for \( i = 1, \ldots, k - 1 \), such that \( \text{Ch}(D) \) is trivial, i.e., if the following diagram holds for \((R, D)\);

\[
\begin{align*}
D & \subset \partial D \subset \cdots \subset \partial^{k-1} D \subset \partial^k D \subset T(R) \\
\cup & \quad \cup & \quad \cup & \quad \cup & \quad \cup \\
\{0\} = \text{Ch}(D) & \subset \text{Ch}(\partial D) \subset \text{Ch}(\partial^2 D) \subset \cdots \subset \text{Ch}(\partial^{k-1} D) \subset F
\end{align*}
\]

where \( \text{rank } \partial^i D = \text{rank } \partial^{i-1} D + m \) for \( i = 1, \ldots, k \) and \( \text{rank } D = m + 1 \).

First, by repeated use of Rank 1 prolongations starting from a manifold \( M \) of dimension \( m + 1 \), we obtain by Proposition 3.1,

**Proposition 4.1.** \((P^k(M), C^k)\) is a special \( m \)-flag of length \( k \).
Conversely, by utilizing the following Realization Lemma, it is known that every special $m$-flag of length $k$ is locally isomorphic to $(P^k(M), C^k)$.

**Realization Lemma ([Y1:p.122])** Let $R$ and $M$ be manifolds. Assume that the quadruple $(R, D, p, M)$ satisfies the following conditions:

(i) $p$ is a map of $R$ into $M$ of constant rank.

(ii) $D$ is a differential system on $R$ such that $F = \text{Ker} p_*$ is a subbundle of $D$ of corank $n$.

Then there exists a unique map $\psi$ of $R$ into $J(M, n)$ satisfying $p = \pi \cdot \psi$ and $D = \psi_*^{-1}(C)$. Furthermore, let $u$ be any point of $R$. Then $\psi$ is in fact defined by

$$\psi(u) = p_*(D(u)) \quad \text{as a point of} \quad \text{Gr}(T_x(M), n), \quad x = \pi(u),$$

and satisfies $\text{Ker} (\psi)_u = F(u) \cap \text{Ch}(D)(u)$.

**Theorem 4.2.** A special $m$-flag $(R, D)$ of length $k$ is locally isomorphic to $(P^k(M), C^k)$, where $M$ is a manifold of dimension $m + 1$. Especially $F$ is unique for $(R, D)$.

**Remark 4.3.** After [MZ], P. Mormul first defined the notion of special $m$-flags of length $k$ for $m \geq 2$ in a slightly different form in [M2] (cf. Theorem 6.2), generalizing the works of [KR] or [PR]. The above theorem was first observed by him in Remark 3 [M2].

In view of Theorem 4.2, our task is to characterize the special $m$-flags among $m$-flags of length $k$, which will be accomplished in the following sections.

5. **Main Theorem** ($m \geq 3$)

Let $(R, D)$ be an $m$-flag of length 1, i.e., $R$ is a manifold of dimension $2m + 1$ such that rank $D = m + 1$ and $\partial D = T(R)$. By definition, $(R, D)$ is a special $m$-flag ($m \geq 2$) if there exists a completely integrable subbundle $F$ of $D$ of corank 1 and $\text{Ch}(D)$ is trivial. Then, by Reliziation Lemma, $(R, D)$ is locally isomorphic to $(P^1(M), C^1) = (J(M, 1), C)$, where $M = R/F$ is (locally) the leaf space of the foliation $F$ on $R$. In case $m = 1$, it is easy to see that a 1-flag of length 1 is a contact manifold of dimension 3. 2-flags of length 1 have peculiar aspects and were extensively studied in [C] (cf. §6). Now we start with the following characterization of special $m$-flags of length 1 for $m \geq 3$.

**Proposition 5.1.** An $m$-flag $(R, D)$ of length 1 for $m \geq 3$ is a special $m$-flag if and only if $D$ is of Cartan rank 1.

Here, the Cartan rank of $(R, D)$ is the smallest integer $\rho$ such that there exist 1-forms $\{\pi^1, \ldots, \pi^\rho\}$, which are independent modulo $\{\eta^1, \ldots, \eta^m\}$ and satisfy

$$d\alpha \wedge \pi^1 \wedge \cdots \wedge \pi^\rho \equiv 0 \quad (\text{mod} \ \eta^1, \ldots, \eta^m) \quad \text{for} \ \forall \alpha \in D^\perp = \Gamma(D^\perp),$$

where $D = \{\eta^1 = \cdots = \eta^m = 0\}$. 
Remark 5.2. As a characterization of 1-jet spaces, Bryant's normal form theorem is well known ([B], [BCG3]). This theorem in 1 independent variable case says that an \( m \)-flag \((R, D)\) of length 1 for \( m \geq 3 \) is a special \( m \)-flag if and only if \( D \) is of Engel (half-) rank 1 and \( \text{Ch}(D) \) is trivial. Here the Engel rank of \((R, D)\) is the smallest integer \( \rho \) such that

\[
(\alpha \rho + 1) \equiv 0 \pmod{\eta^1, \ldots, \eta^m} \quad \text{for } \forall \alpha \in D^\perp,
\]

where \( D = \{\eta^1 = \cdots = \eta^m = 0\} \). Here we observe that we cannot replace the Cartan rank 1 condition in the above Proposition by the Engel rank 1 condition when \( m = 3 \), as the following example shows; Let \((y^1, y^2, y^3, x^0, x^1, x^2, x^3)\) be a coordinate system of \( R \). Let us take a coframe \( \{\eta^1, \eta^2, \eta^3, \theta^i, (i = 0, 1, 2, 3)\} \) as follows;

\[
\eta^1 = dy^1 + x^2 dx^3, \quad \eta^2 = dy^2 + x^3 dx^1, \quad \eta^3 = dy^3 + x^1 dx^2, \quad \theta^i = dx^i.
\]

Then, for \( D = \{\eta^1 = \eta^2 = \eta^3 = 0\} \), we have

\[
\begin{align*}
\mathrm{d}\eta^1 & \equiv \theta^2 \wedge \theta^3 \pmod{\eta^1, \eta^2, \eta^3}, \\
\mathrm{d}\eta^2 & \equiv \theta^3 \wedge \theta^1 \pmod{\eta^1, \eta^2, \eta^3}, \\
\mathrm{d}\eta^3 & \equiv \theta^1 \wedge \theta^2 \pmod{\eta^1, \eta^2, \eta^3}.
\end{align*}
\]

Thus \((R, D)\) is a 3-flag of length 1 such that \((R, D)\) is of Engel rank 1 and has non-trivial \( \text{Ch}(D) \).

However we can replace the Cartan rank 1 condition in the above Proposition by the Engel rank 1 condition when \( m \geq 4 \), as the following Lemma implies.

\[\text{Lemma 5.3.} \quad \text{Let } V \text{ be a vector space over } \mathbb{R}. \text{ Let } \omega_1, \ldots, \omega_r \in \wedge^2 V \text{ be 2-forms such that } \{\omega_1, \ldots, \omega_r\} \text{ are linearly independent and } \omega_i \wedge \omega_j = 0 \text{ for } 1 \leq i \leq j \leq r. \text{ Then}
\]

(1) In case \( r = 2 \). There exist vectors \( v_0, v_1, v_2 \in V \), which are linearly independent, such that

\[
\omega_1 = v_0 \wedge v_1, \quad \omega_2 = v_0 \wedge v_2.
\]

(2) In case \( r = 3 \). Either of the followings holds

(i) There exist vectors \( v_1, v_2, v_3 \in V \), which are linearly independent, such that

\[
\omega_1 = v_2 \wedge v_3, \quad \omega_2 = v_3 \wedge v_1, \quad \omega_3 = \pm v_1 \wedge v_2.
\]

(ii) There exist vectors \( v_0, v_1, v_2, v_3 \in V \), which are linearly independent, such that

\[
\omega_1 = v_0 \wedge v_1, \quad \omega_2 = v_0 \wedge v_2, \quad \omega_3 = v_0 \wedge v_3.
\]

(3) In case \( r \geq 4 \). There exist vectors \( v_0, \ldots, v_r \in V \), which are linearly independent, such that

\[
\omega_1 = v_0 \wedge v_1, \quad \omega_2 = v_0 \wedge v_2, \quad \ldots, \quad \omega_r = v_0 \wedge v_r.
\]

In case \( m = 1 \), every Goursat flag of length \( k \) \((k \geq 2)\) is a special 1-flag, i.e., the Sandwich Lemma holds automatically ([MZ]). By contrast, we need some condition for an \( m \)-flag of length 2 \((m \geq 2)\) to be special as the following example shows.
Example 5.4. Let $R$ be a manifold of dimension $3m + 1$ $(m \geq 2)$, and let $(x^\alpha, y^\beta, z^\beta)$ $(\alpha = 0, 1, \ldots, m, \beta = 1, \ldots, m)$ be a coordinate system on $R$. For a fixed $a \in \{0, 1, \ldots, m - 2\}$, let us take a coframe $\{\eta^1, \eta^m, \zeta^1, \ldots, \zeta^m, \theta^0, \ldots, \theta^m\}$ as follows;

\[
\theta^a = dx^a, \quad \eta^\gamma = dz^\gamma + y^\gamma dx^0 - \frac{1}{2}(x^0)^2 dx^\gamma \quad (\gamma = 1, \ldots, m-a-1) \\
\zeta^\beta = dy^\beta + x^0 dx^\beta, \quad \eta^\delta = dx^\delta + y^\delta dx^\delta-1 \quad (\delta = m-a, \ldots, m)
\]

We consider $D = \{\eta^1 = \cdots = \eta^m = \zeta^1 = \cdots = \zeta^m = 0\}$. Then we have

\[
\begin{align*}
\{ \, d\eta^\beta & \equiv 0 \pmod{\eta^1, \ldots, \eta^m, \zeta^1, \ldots, \zeta^m} \, \text{ for } \beta = 1, \ldots, m, \\
\{ \, d\zeta^\beta & \equiv \theta^0 \land \theta^\beta \pmod{\eta^1, \ldots, \eta^m, \zeta^1, \ldots, \zeta^m} \, \text{ for } \beta = 1, \ldots, m, \\
\{ \, d\eta^\gamma & \equiv \zeta^\gamma \land \theta^0 \pmod{\eta^1, \ldots, \eta^m} \, \text{ for } \gamma = 1, \ldots, m-a-1, \\
\{ \, d\eta^\delta & \equiv \zeta^{\delta-1} \land \theta^{\delta-1} \pmod{\eta^1, \ldots, \eta^m} \, \text{ for } \delta = m-a, \ldots, m.
\end{align*}
\]

Hence we get

\[
\partial D = \{\eta^1 = \cdots = \eta^m = 0\}, \quad \partial^2 D = T(R)
\]

\[
\text{Ch}(\partial D) = \{\eta^1 = \cdots = \eta^m = \zeta^1 = \cdots = \zeta^{m-1} = \theta^0 = \theta^{m-a-1} = \cdots = \theta^{m-1} = 0\}
\]

Thus, $(R, D)$ is an $m$-flag of length 2, but $\text{Ch}(\partial D)$ is not a subbundle of $D$. Moreover rank $\text{Ch}(\partial D)$ is $m-a$.

In order to get good control over $\text{Ch}(\partial D)$, we prepare the following proposition, which gives us the Sandwich Lemma for $m \geq 3$.

Proposition 5.5. Let $(R, D)$ be a regular differential system such that rank $\partial^2 D = \text{rank } \partial D + m$ and rank $\partial D = \text{rank } D + m$. Assume $m \geq 3$ and the Cartan rank of $\partial D$ is 1, then $\text{Ch}(\partial D)$ is a subbundle of $D$ of corank 1. Moreover the Cartan rank of $D$ is 1.

In view of Lemma 5.3, we can replace the Cartan rank 1 condition by the Engel rank 1 condition when $m \geq 4$ (cf. Remark 5.6).

Remark 5.6. We cannot replace the Cartan rank 1 condition in the above Proposition by the Engel rank 1 condition when $m = 3$, as the following example shows; Let $(x^1, x^2, x^3, y^1, y^2, y^3, x^0, x^1, x^2, x^3)$ be a coordinate system of $R$. Let us take a coframe $\{\eta^1, \eta^2, \eta^3, \zeta^1, \zeta^2, \zeta^3, \theta^0, \theta^1, \theta^2, \theta^3\}$ as follows;

\[
\begin{align*}
\eta^1 &= dx^1 + y^1 dx^0, \quad \eta^2 = dx^2 + y^2 dy^1, \quad \eta^3 = dx^3 + x^0 dy^2, \quad \theta^0 = dx^0, \quad \theta^1 = dx^1, \\
\zeta^1 &= dy^1 - x^1 dx^0, \quad \zeta^2 &= dy^2 - x^2 dx^0, \quad \zeta^3 &= dy^3 - x^3 dx^0, \quad \theta^2 = dx^2, \quad \theta^3 = dx^3.
\end{align*}
\]

We consider $D = \{\eta^1 = \eta^2 = \eta^3 = \zeta^1 = \zeta^2 = \zeta^3 = 0\}$. Then we have

\[
\begin{align*}
\{ \, d\eta^\beta & \equiv 0 \pmod{\eta^1, \eta^2, \eta^3, \zeta^1, \zeta^2, \zeta^3} \, \text{ for } \beta = 1, 2, 3, \\
\{ \, d\zeta^\beta & \equiv \theta^0 \land \theta^\beta \pmod{\eta^1, \eta^2, \eta^3, \zeta^1, \zeta^2, \zeta^3} \, \text{ for } \beta = 1, 2, 3,
\end{align*}
\]

\[
\begin{align*}
\{ \, d\eta^1 & \equiv \zeta^1 \land \theta^0 \pmod{\zeta^1, \zeta^2, \zeta^3}, \\
\{ \, d\eta^2 & \equiv (\zeta^2 + x^2 \theta^0) \land (\zeta^1 + x^1 \theta^0) \pmod{\eta^1, \eta^2, \eta^3}, \\
\{ \, d\eta^3 & \equiv \theta^0 \land \zeta^2 \pmod{\eta^1, \eta^2, \eta^3}.
\end{align*}
\]

Hence we get
\[ \partial D = \{ \eta^1 = \eta^2 = \eta^3 = 0 \} , \quad \partial^2 D = T(R), \]
\[ \text{Ch}(\partial D) = \{ \eta^1 = \eta^2 = \eta^3 = \zeta^1 = \zeta^2 = \theta^0 = 0 \}. \]

Thus, \((R, D)\) is an 3-flag of length 2 such that the Engel rank of \(\partial D\) is 1, but \(\text{Ch}(\partial D)\) is not a subbundle of \(D\).

However, by Lemma 5.3, we can replace the Cartan rank 1 condition in the above Proposition by the Engel rank 1 condition when \(m \geq 4\).

By utilizing the above proposition repeatedly, we obtain

**Theorem 5.7.** An \(m\)-flag \((R, D)\) of length \(k\) for \(m \geq 3\) is a special \(m\)-flag if and only if \(\partial^{k-1} D\) is of Cartan rank 1. Moreover, an \(m\)-flag \((R, D)\) of length \(k\) for \(m \geq 4\) is a special \(m\)-flag if and only if \(\partial^{k-1} D\) is of Engel rank 1.

Hence, by Theorem 4.2, we obtain the Drapeau Theorem for \(m \geq 3\)

**Corollary 5.8.** Let \(M\) be a manifold of dimension \(m + 1\). An \(m\)-flag \((R, D)\) of length \(k\) for \(m \geq 3\) is locally isomorphic to \((P^k(M), C^k)\) if and only if \(\partial^{k-1} D\) is of Cartan rank 1, and, moreover for \(m \geq 4\), if and only if \(\partial^{k-1} D\) is of Engel rank 1.

### 6. Integrable Subbundle of Corank 1

Let \((R, D)\) be a 2-flag of length 1. Then it can be shown ([C]) that there exists a local coframe \(\{\eta^1, \eta^2, \theta^0, \theta^1, \theta^2\}\) such that \(D = \{\eta^1 = \eta^2 = 0\} \),

\[
\begin{align*}
\{ d\eta^1 &\equiv \theta^0 \wedge \theta^1 \quad \text{(mod } \eta^1, \eta^2) , \\
\{ d\eta^2 &\equiv \theta^0 \wedge \theta^2 \quad \text{(mod } \eta^1, \eta^2) \\n\end{align*}
\]

Thus the Cartan rank of \((R, D)\) is always 1 and we have the covariant system \(F = \{\eta^1 = \eta^2 = \theta^0 = 0\}\) of \(D\) of corank 1 (cf. [Y3]). As is well known, \(F\) is not necessarily completely integrable.

As for a 2-flag of length 2, we observe that, in Example 5.4, putting \(m = 2\), we obtain the following structure equation for \(D = \{\eta^1 = \eta^2 = \zeta^1 = \zeta^2 = 0\}\), where

\[
\begin{align*}
\eta^1 &= dx^1 + y^1 dx^0 - \frac{1}{2}(x^0)^2 dx^1, \quad \eta^2 = dx^2 + y^1 dx^1 \\
\zeta^1 &= dy^1 + x^0 dx^1, \quad \zeta^2 = dy^2 + x^0 dx^2, \quad \theta^0 = dx^0, \quad \theta^1 = dx^1, \quad \theta^2 = dx^2, \\
\end{align*}
\]

\[
\begin{align*}
\{ d\eta^0 &\equiv 0 \quad \text{(mod } \eta^1, \eta^2, \zeta^1, \zeta^2) \quad \text{for } \beta = 1, 2, \\
\{ dc^\beta &\equiv \theta^0 \wedge \theta^\beta \quad \text{(mod } \eta^1, \eta^2, \zeta^1, \zeta^2) \quad \text{for } \beta = 1, 2. \\
\end{align*}
\]

Thus \(\partial D = \{\eta^1 = \eta^2 = 0\}\) and the Cartan rank of \(\partial D\) is 1, whereas \(\text{Ch}(\partial D)\) is not a subbundle of \(D\). This shows that the statement of Proposition 5.5 is false for \(m = 2\).
To cover the case $m = 2$, we strengthen the hypothesis of Proposition 5.5 as in the following.

**Proposition 6.1.** Let $(R, D)$ be a regular differential system such that rank $\partial^2 D = \text{rank} \partial D + m$ and rank $\partial D = \text{rank} D + m$. Assume that there exists a completely integrable subbundle $F$ of $\partial D$ of corank 1, then $\text{Ch}(\partial D)$ is a subbundle of $D$ of corank 1.

By utilizing the above proposition repeatedly, we obtain

**Theorem 6.2.** An $m$-flag $(R, D)$ of length $k$ is a special $m$-flag if and only if there exists a completely integrable subbundle $F$ of $\partial^{k-1} D$ of corank 1. Moreover, $F$ is unique for $(R, D)$.

**Corollary 6.3.** Let $M$ be a manifold of dimension $m + 1$. An $m$-flag $(R, D)$ of length $k$ is locally isomorphic to $(P^k(M), C^k)$ if and only if there exists a completely integrable subbundle $F$ of $\partial^{k-1} D$ of corank 1.
