KILLING SOME S-SPACES BY A COHERENT SUSLIN TREE

静岡大学理学部 依岡 輝幸 (Yorioka Teruyuki)
Department of Mathematics, Shizuoka University

1. INTRODUCTION

A regular space \((X, \tau)\) is called hereditarily separable if every subspace is separable, i.e.

\[
\forall Y \subseteq X \exists Z \in [Y]^{\leq \aleph_0} \forall U \in \tau \left( U \cap Y \neq \emptyset \rightarrow U \cap Z \neq \emptyset \right)
\]

and is called hereditarily Lindelöf if every subspace is Lindelöf, i.e.

\[
\forall U \subseteq \tau \exists V \in \mathcal{U}^{\leq \aleph_0} \forall x \in X \left( x \in \bigcup \mathcal{U} \rightarrow x \in \bigcup \mathcal{V} \right).
\]

Their properties look like dual notions in the sense that points are switched with open sets in their definitions. It was one of famous open problems in general topology whether they coincide. A regular space is called an S-space \(^1\) if it is hereditarily separable but not hereditarily Lindelöf, and is called an L-space if it is hereditarily Lindelöf but not hereditarily separable. Stevo Todorčević proved that PFA implies that there are no S-spaces, e.g. [16], and Justin Tatch Moore proved that there are L-spaces [7, 8]. Zoltán Szentmiklóssy proved that \(\text{MA}_{\aleph_1}\) implies that there are no compact S-spaces [14]. For the study of S and L spaces, see [16], and [1, 10, 13].

The \(P\)-ideal dichotomy is defined by Todorčević. The origin of the \(P\)-ideal dichotomy is an analysis of the problem whether every hereditarily separable regular space is Lindelöf (i.e. there are no S-spaces [18, §23], and he proved that PFA implies the \(P\)-ideal dichotomy (e.g. [17]) and if the \(P\)-ideal dichotomy holds and \(p > \aleph_1\), then there are no S-spaces [18, §23]. According to [10, §7], Todorčević firstly proved that PFA implies no S-spaces directly, that is, he proved that for each right-separated

\(^1\) Usually, an S-space is denoted by an \('S'\)-space. However, in this note, we always use \(S\) as a (particular) coherent Suslin tree. So we adopt notation an \('S'\)-space.

Sometime an S-space is defined as a hereditarily separable non-Lindelöf regular space. But our terminology allows us to consider e.g. compact S-space [1]. We note that every compact space is of course Lindelöf.
(2) hereditarily separable regular space of type $\omega_1$, there is a proper forcing which adds an uncountable discrete subspace. It follows that \textbf{PFA} implies no S-spaces, because every S-space has a right-separated subspace of type $\omega_1$, and a right-separated regular space of type $\omega_1$ is an S-space iff it has no uncountable discrete subspace (e.g. [10, §3]).

In [19], Stevo Todorčević introduced the forcing axiom \textbf{PFA}(S), which says that there exists a coherent Suslin tree $S$ such that the forcing axiom holds for every proper forcing which preserves $S$ to be Suslin, that is, for every proper forcing $\mathbb{P}$ which preserves $S$ to be Suslin and $\aleph_1$-many dense subsets $D_\alpha, \alpha \in \omega_1$, of $\mathbb{P}$, there exists a filter on $\mathbb{P}$ which intersects all $D_\alpha$'s. \textbf{PFA}(S)[S] denotes the forcing extension with the coherent Suslin tree $S$ which is a witness of \textbf{PFA}(S). Since the preservation of a Suslin tree by the proper forcing is closed under countable support iteration (due to Tadatoshi Miyamoto [6]), it is consistent relative to some large cardinal assumption that \textbf{PFA}(S) holds.

The first appear of such a forcing axiom is in the paper [5] due to Paul B. Larson and Todorčević. In this paper, they introduced the weak version of \textbf{PFA}(S), called Souslin’s Axiom (in which the properness is replaced by the cccness), and under this axiom, the coherent Suslin tree $S$, which is a witness of the axiom, forces a weak fragment of Martin’s Axiom. In [19], it is also proved that under \textbf{PFA}(S), $S$ forces the open graph dichotomy (3) and the $P$-ideal dichotomy. Namely, many consequences of \textbf{PFA} are satisfied in the extension with $S$ under \textbf{PFA}(S). On the other hand, many people proved that some consequences from $\diamondsuit$ are satisfied in the extension with a Suslin tree (e.g. [9, Theorem 6.15.]). In particular, the pseudo-intersection number $\mathfrak{p}$ is $\aleph_1$ in the extension with a Suslin tree. In fact, the extension with $S$ under \textbf{PFA}(S) is designed as a universe which satisfied some consequences of $\diamondsuit$ and \textbf{PFA} simultaneously. By the use of this model, Larson and Todorčević proved that the affirmative answer of Katětov problem is consistent [5].

It is not known whether under \textbf{PFA}(S), $S$ (which is a witness of \textbf{PFA}(S)) forces that there are no S-spaces. In [19], Todorčević proved that there are no compact S-spaces in the extension with $S$ under \textbf{PFA}(S). To do this, he develops the theory of compact countably tight spaces in \textbf{PFA}(S)[S], and proved that under \textbf{PFA}(S), $S$ forces that every non-Lindelöf subspace of a compact countably tight space has an uncountable discrete subspace [19, 8.6 Theorem]. If fact, he

\footnote{A space is called right-separated if the set of points can be well-ordered such that every initial segments is open. We note that an uncountable right-separated space is not Lindelöf, and a non-hereditarily Lindelöf space has an uncountable right-separated subspace [10, §3].}

\footnote{This is so called the open coloring axiom [16, §8].}
proved that for every $S$-name for a non-Lindelöf subspace of a compact countably tight space, there is a proper forcing which adds an $S$-name for an uncountable discrete subspace. In this note, we will show the following.

**Proposition 1.1.** Let $\dot{\tau}$ be an $S$-name for a right-separated hereditarily separable regular topology of type $\omega_1$, and suppose that $\dot{\tau}$ has the following property:

- For any point $\delta \in \omega_1$, $S$-name $\dot{U}$ for an open neighborhood of $\delta$, $\alpha \in \omega_1$, $t \in S_\alpha$ and $F \in [S_\alpha]^{<\aleph_0}$, there exists an $S$-name $\dot{U}'$ for an open neighborhood of $\delta$ such that $t \forces_S \dot{U}' \subseteq \dot{U}$ and for every $s \in F$,

$$s \forces_S \psi_{t,s}(\dot{U}') \text{ is open in } \dot{\tau}.$$  

Then $\mathbb{P}$ is proper and preserves $S$ to be Suslin.

It follows from this proposition that under PFA($S$), $S$ forces that every topology on $\omega_1$ generated by a basis in the ground model is not an $S$-topology. In [11, 12], Mary Ellen Rudin proved that the negation of Suslin Hypothesis (i.e. there exists a Suslin tree) implies the existence of $S$-spaces, so under PFA($S$), there are $S$-spaces. By the proposition, we notice that they cannot generate an $S$-topology in the extension with $S$.

At last in the introduction, we introduce a coherent Suslin tree. A coherent Suslin tree $S$ consists of functions in $\omega^{<\omega_1}$ and closed under finite modifications. That is,

- for any $s$ and $t$ in $S$, $s \leq_S t$ iff $s \subseteq t$,
- $S$ is closed under taking initial segments,
- for any $s$ and $t$ in $S$, the set

$$\{\alpha \in \min\{\ellv(s), \ellv(t)\}; s(\alpha) \neq t(\alpha)\}$$

is finite (here, $\ellv(s)$ is the length of $s$, that is, the size of $s$), and
- for any $s \in S$ and $t \in \omega^{\ellv(s)}$, if the set $\{\alpha \in \ellv(s); s(\alpha) \neq t(\alpha)\}$ is finite, then $t \in S$ also.

For a countable ordinal $\alpha$, let $S_\alpha$ be the set of the $\alpha$-th level nodes, that is, the set of all members of $S$ of domain $\alpha$, and let $S_{\leq \alpha} := \bigcup_{\beta \leq \alpha} S_\beta$. For $s \in S$, we let

$$S|s := \{u \in S; s \leq_S u\}.$$  

We note that $\Diamond$, or adding a Cohen real, builds a coherent Suslin tree. A coherent Suslin tree has canonical commutative isomorphisms.
Let $s$ and $t$ be nodes in $S$ with the same level. Then we define a function $\psi_{s,t}$ from $S \upharpoonright s$ into $S \upharpoonright t$ such that for each $v \in S \upharpoonright s$,

$$\psi_{s,t}(v) := t \cup (v \upharpoonright [l(v(s)), l(v)])$$

(here, $v \upharpoonright [l(v(s)), l(v)]$ is the function $v$ restricted to the domain $[l(v(s)), l(v)]$). We note that $\psi_{s,t}$ is an isomorphism, and if $s$, $t$, $u$ are nodes in $S$ with the same level, then $\psi_{s,t}$, $\psi_{t,u}$ and $\psi_{s,u}$ commutes. (On a coherent Suslin tree, see e.g. [2, 4].)

**Theorem 1.2** (Miyamoto, [6, (1.1) Proposition.]). For a Suslin tree $S$ and a proper forcing $\mathbb{P}$, $\mathbb{P}$ preserves $S$ to be Suslin iff for any sufficiently large regular cardinal $\theta$, any countable elementary substructure $N$ of $H(\theta)$ which contains $\mathbb{P}$ and $S$ as members, any $(\mathbb{P}, N)$-generic $p$ and any $t \in S$ of level $\omega_1 \cap N$, the pair $\langle p, t \rangle$ is $(\mathbb{P} \times S, N)$-generic.

2. A PROOF OF PROPOSITION 1.1

Let $S$ be a coherent Suslin tree and $\tau$ an $S$-name for a regular topology on $\omega_1$ such that

$$\Vdash_S \langle (\omega_1, \tau, <) \rangle \text{ is right-separated and hereditarily separable}$$

where $<$ denotes the usual order of ordinals. If there exists a proper forcing which preserves $S$ to be Suslin and adds an $S$-name for an uncountable discrete subset of $(\omega_1, \tau)$, then under PFA($S$), $S$ (which is a witness of PFA($S$)) forces that there are no $S$-spaces.

We consider a plain forcing notion which adds an $S$-name for an uncountable discrete subset of $(\omega_1, \tau)$ as in [16, 8.9. Theorem]. To do this, for each $\alpha \in \omega_1$, since $(\omega_1, \tau)$ is an $S$-name for a right-separated regular space, we take an $S$-name $\dot{U}_\alpha$ such that

$$\Vdash_S \langle \alpha \in \dot{U}_\alpha \in \tau, \text{ (i.e. open)} \rangle \text{ and } \text{cl}_\tau(\dot{U}_\alpha) \cap [\alpha + 1, \omega_1) = \emptyset$$

$\mathbb{P}$ consists of finite functions $p$ such that

- $\text{dom}(p)$ is a finite $\in$-chain of countable elementary submodels of $H(\aleph_2)$ with $S, \tau$ and $\langle \dot{U}_\alpha; \alpha \in \omega_1 \rangle$,
- for any $M \in \text{dom}(p)$, $p(M) = (t_M, \alpha_M) \in (S \setminus M) \times (\omega_1 \setminus M)$ (hence $p(M) \notin M$),
- for any $M \in \text{dom}(p)$ and $\beta \in \omega_1 \cap M$, $t_M$ decides whether $\beta \in \dot{U}_{\alpha_M}$ or not,
- for any $M, M' \in \text{dom}(p)$, if $M \in M'$, then $t_M, \alpha_M \in M'$, and
- for any $M, M' \in \text{dom}(p)$, if $t_M <_S t_{M'}$, then

$$t_{M'} \Vdash_S \langle \alpha_M \notin \dot{U}_{\alpha_{M'}} \rangle$$
ordered by extensions. If \( P \) is proper and preserves \( S \) to be Suslin, then this \( P \) is as desired for a proof of no \( S \)-spaces in \( PFA(S)[S] \). However, it is not known whether this is true in general. Now we assume the following property of the \( S \)-name \( \dot{\tau} \):

\( \star \) For any point \( \delta \in \omega_1 \), \( S \)-name \( \dot{U} \) for an open neighborhood of \( \delta \), \( \alpha \in \omega_1 \), \( t \in S_\alpha \) and \( F \in [S_\alpha]^{<\aleph_0} \), there exists an \( S \)-name \( \dot{U}' \) for an open neighborhood of \( \delta \) such that \( t \Vdash_S \{ \dot{U}' \subseteq \dot{U} \} \) and for every \( s \in F \),

\[ s \Vdash_S \{ \psi_{t,s}(\dot{U}') \text{ is open in } \dot{\tau} \} \]

We note that in this property, for an \( s \in F \), \( s = \psi_{t,s}(t) \), and so it is true that

\[ s \Vdash_S \{ \psi_{t,s}(\dot{U}') \text{ is open in } \psi_{t,s}(\dot{\tau}) \} \]

but it may happen that

\[ s \not\Vdash_S \{ \psi_{t,s}(\dot{U}') \text{ is open in } \dot{\tau} \} \]

However, for example, if \( \dot{\tau} \) is an \( S \)-name for a topology generated by an open basis in the ground model, then this is true. So it follows from this proposition that under \( PFA(S) \), \( S \) forces that every topology on \( \omega_1 \) generated by a basis in the ground model is not an \( S \)-topology.

In the rest of this section, we prove that \( P \) is proper and preserves \( S \) to be Suslin under the assumption of \( \dot{\tau} \) above.

Let \( \theta \) be a large enough regular cardinal, \( N \) a countable elementary submodel of \( H(\theta) \) such that \( N \) contains \( S \), \( \dot{\tau} \), \( \dot{U}_\alpha ; \alpha \in \omega_1 \), \( P \) and \( H(N_2) \), and \( p_0(M) \in P \cap N \). For each \( M \in \text{dom}(p_0) \), we write \( p_0 = \langle \beta, \alpha^p \rangle \). Let \( N' := N \cap H(N_2) \), which is a countable elementary submodel of \( H(N_2) \). We take (arbitrary) \( \alpha^p_{N'} \in \omega_1 \setminus N \), and take \( t^p_{N'} \in S \setminus N \) such that for every \( M \in \text{dom}(p_0) \), \( t^p_M \) and \( t^p_{N'} \upharpoonright (\omega_1 \cap N) \) are incomparable in \( S \), and \( t^p_{N'} \) decides whether \( \beta \in \dot{U}_{\alpha^p_{N'}} \) or not for every \( \beta \in \omega_1 \setminus N \). Then we define

\[ p_1 := p_0 \cup \{ \langle N', \langle t^p_{N'}, \alpha^p_{N'} \rangle \rangle \} \]

which is a condition of \( P \) and moreover an extension of \( p_0 \). Let \( s_1 \in S_{\omega_1 \cap N} \). We show that \( \langle p_1, s_1 \rangle \) is \( (N, P \times S) \)-generic, which finishes the proof.

Let \( D \in N \) be a dense open subset of \( P \times S \). Let \( r \leq_p p_1 \) and \( u \geq_s s_1 \) be such that \( \langle r, u \rangle \in D \). By extending \( u \) if necessary, we may assume that for every \( M \in \text{dom}(r) \), \( \nu(u) \geq \nu(t^r_M) \) holds (where we denote
$r(M) = \{t_M^r, \alpha_M^r\rangle\). By the coherency of $S$, we can take $\gamma \in \omega_1 \cap N$ such that for every $M \in \text{dom}(r)$,

$$\{\xi \in \text{lv}(t_M^r) \cap \text{lv}(s_1); t_M^r(\xi) \neq s_1(\xi)\} \subseteq \gamma.$$

We note that

$$\{\xi \in \text{lv}(t_M^r) \cap \text{lv}(s_1); t_M^r(\xi) \neq s_1(\xi)\} = \{\xi \in \text{lv}(t_M^r) \cap \omega_1 \cap N; t_M^r(\xi) \neq u(\xi)\}.$$

We enumerate $\text{dom}(r)$ by $\{M_i^r; i \in n\}$ with respect to $\in$-increasing.

For each $v \in S$, we define

$$T_v := \left\{\langle \alpha_M^q; M \in \text{dom}(q) \setminus \text{dom}(r \cap N)\rangle; \begin{array}{l}
q \in \mathbb{P} \cap N,
q \text{ is an end-extension of } r \cap N,
\langle q, v \rangle \in \mathcal{D},
|q| = |r| = n, \text{ and say } \text{dom}(q) = \{M_i^q; i \in n\} \text{ which is an } \\
\in\text{-increasing enumeration},
\text{for every } M \in \text{dom}(q), \text{ lv}(t_M^q) \leq \text{lv}(v),
\text{for every } i \in n, t_{M_i}^q(\gamma) = t_M^r(\gamma) \text{ and }
\end{array} \right\}$$

We note that $\langle T_v; v \in S\rangle$ belongs to the model $N$, and for any $v, v' \in S$, if $v \leq_S v'$, then $T_v \subseteq T_{v'}$. We consider each $T_v$ as a tree which consists of all initial segments of its members, here we consider that $\langle \alpha_M^q; M \in \text{dom}(q) \setminus \text{dom}(r \cap N)\rangle$ is ordered by the usual order on ordinals. For each $v \in S$, we shrink the tree $T_v$ to the set

$$T_v \setminus \left\{\sigma \in T_v; \exists \sigma' \in T_v \text{ such that } |\sigma'| = n - |r \cap N| - 1, \sigma' \subseteq \sigma \text{ and } \begin{array}{l}
v \not\models S " \left\{\beta \in \omega_1; \exists t \in \dot{G}(\sigma' \rangle \in T_t') \right\} \text{ is uncountable}" \right\}.\right.$$
We note again that \( \langle T'_v; v \in S \rangle \) also belongs to the model \( N \).

**Claim 2.1.** \( \langle \alpha^r_M; M \in \text{dom}(r \setminus N) \rangle \) is a cofinal path through \( T'_u \).

**Proof of Claim 2.1.** Suppose that \( \sigma \prec \langle \alpha \rangle \) is an initial segment of \( \langle \alpha^r_M; M \in \text{dom}(r \setminus N) \rangle \) and \( \sigma \prec \langle \alpha \rangle \in T'_u \). Show that \( \sigma \in T'_u \), that is,
\[
\models_S \left\{ \beta \in \omega_1; \exists t \in \dot{G} \left( \sigma \prec \langle \beta \rangle \in T'_t \right) \right\} \quad \text{is uncountable}.
\]
Let \( M \in \text{dom}(r \setminus N) \) be such that \( \sigma \in M \) and \( \alpha \notin M \). Since \( \nu(u) \geq \nu(t^*_M) \geq \omega_1 \cap M \), \( u \) is \((S, M)\)-generic.

Suppose that
\[
\models_S \left\{ \beta \in \omega_1; \exists t \in \dot{G} \left( \sigma \prec \langle \beta \rangle \in T'_t \right) \right\} \quad \text{is uncountable}.
\]
Then some extension of \( u \) forces that \( \left\{ \beta \in \omega_1; \exists t \in \dot{G} \left( \sigma \prec \langle \beta \rangle \in T'_t \right) \right\} \) is countable. Since such an extension is also \((M, S)\)-generic and the phrase "the set \( \left\{ \beta \in \omega_1; \exists t \in \dot{G} \left( \sigma \prec \langle \beta \rangle \in T'_t \right) \right\} \) is countable" can be described in \( M \), there exists \( w \in S \cap M \) such that \( w \leq_S u \) and
\[
w \models_S \left\{ \beta \in \omega_1; \exists t \in \dot{G} \left( \sigma \prec \langle \beta \rangle \in T'_t \right) \right\} \quad \text{is countable}.
\]
(4). Since \( S \) is \( K_0 \)-distributive, there are a countable set \( Z \) in \( N \) and \( w' \in S \cap M \) such that \( w \leq_S w' \leq_S u \) and
\[
w' \models \quad Z = \left\{ \beta \in \omega_1; \exists t \in \dot{G} \left( \sigma \prec \langle \beta \rangle \in T'_t \right) \right\} \quad \text{"}.
\]
This is a contradiction because \( u \geq_S w' \) and
\[
u \models \quad \alpha \in \left\{ \beta \in \omega_1; \exists t \in \dot{G} \left( \sigma \prec \langle \beta \rangle \in T'_t \right) \right\} \setminus Z \quad \text{"}.
\]
\( \vdash \) and (Claim 2.1)

Therefore, letting \( m := |r \setminus N| \), the set
\[
\left\{ v \in S; u \parallel_S v \text{ and } T'_v \text{ is of height } m \right\}
\]
is not empty, in particular, contains \( u \) as a member. We note that this set is in \( N \), so since \( u \) is \((S, N)\)-generic, there exists \( s_2 \in S \cap N \) such that \( s_2 \leq_S u \) and \( T'_{s_2} \) has a cofinal branch of height \( m \). Let
\[
a := \left\{ i \in n \setminus m; t^*_{M_i} \upharpoonright \left[ \gamma, \nu(t^*_M) \right] = u \upharpoonright \left[ \gamma, \nu(t^*_M) \right] \right\}.
\]

\(^4\)If \( u \) is \((M, S)\)-generic and \( A \in M \cap \mathcal{P}(S) \) contains \( u \) as a member, then there exists \( w \in A \cap M \) with \( w \leq_S u \). Because the set \( \{ t \in S; (S|t) \cap A = \emptyset \text{ or } t \in A \} \) is in \( M \) and dense in \( S \). So there exists \( w <_S u \) which belongs to this set (we should remember that the set \( \{ w \in S; w <_S u \} \) is an \((S, M)\)-generic filter). Since \( u \in A \), it have to be true that \( w \in A \).
If $a$ is empty, then for any cofinal path of $T_{s_2}^r$ in $N$ and its witness $p_2 \in \mathbb{P} \cap N$, $(p_2, s_2) \in \mathcal{D} \cap N$ and by the choice of $\gamma$, $(r \cup p_2, u)$ is a common extension of $(r, u)$ and $(p_2, s_2)$ \footnote{Because then for any $M \in \text{dom}(p_2) \setminus \text{dom}(r \cap N)$ and $M' \in \text{dom}(r \setminus N)$, it is true that $\text{lv}(t_{M}^{p_2}) \leq \text{lv}(s_2) < w_1 \cap N \leq \text{lv}(t_{M'}^{r})$, $t_{M}^{p_2} \cap [\gamma, \text{lv}(t_{M}^{p_2})] \neq s_2 \cap [\gamma, \text{lv}(t_{M}^{p_2})]$, $t_{M'}^{r} \cap [\gamma, w_1 \cap N] = u \cap [\gamma, w_1 \cap N]$ and $s_2 \leq_s u$, hence it holds that $t_{M}^{p_2} \not\leq_s t_{M'}^{r}$.}, so the proof is finished. Therefore the interesting case is that $a$ is not empty.

Suppose that $a$ is not empty. Let $\hat{X}_0$ be an $S$-name such that

$$
\models_S " \hat{X}_0 := \{ \beta \in \omega_1; \exists t \in \dot{G} \left( \langle \beta \rangle \in T_t \right) \} ".
$$

We note that $\hat{X}_0 \in N$ and

$$
s_2 \models_S " \hat{X}_0 \text{ is uncountable}".
$$

Since $s_1$ is $(S, N)$-generic above $s_2$, $S$ is $\aleph_0$-distributive and $(\omega_1, \dot{\tau})$ is an $S$-name for a hereditarily separable space, there are $s_2^0 \in S \cap N$ and a countable set $Y_0$ in $N$ such that $s_2 \leq s$, $s_2^0 \leq S s_1 (\leq s u)$ and

$$
s_2^0 \models_S " Y_0 \subseteq \hat{X}_0 \text{ and } \text{cl}_\tau(\hat{X}_0) = \text{cl}_\tau(Y_0)".
$$

For each $i \in n \setminus m$, let

$$b_i := \{ j \in a \setminus m; t_{M_j}^{i} \cap [\gamma] = t_{M_j}^{i} \cap [\gamma] \}.
$$

We note that for each $j \in b_i$, by the choice of $\gamma$, $t_{M_j}^{i} \cap (\omega_1 \cap N) = t_{M_j}^{i} \cap (\omega_1 \cap N)$.

**Claim 2.2.** There exists $\beta_0 \in Y_0$ such that for every $j \in b_m$,

$$
t_{M_j}^{i} \models_S " \beta_0 \notin \dot{U}_{\alpha_{M_j}^{r}} ".
$$

**Proof of Claim 2.2.** Let $b_i = \{ j_\zeta; \zeta \in k \}$ and take any $w_\zeta \in S$ such that $t_{M_j}^{i} \cap \omega_1 \leq S w_\zeta$, all $w_\zeta$ has the same level, and for some $\delta \in \omega_1$ which is larger than $\max_{j \in b_i} t_{M_j}^{i} \cap \omega_1 \cap N$ (we notice that this closure operator is an $S$-name). By induction on $\zeta \in k$, we take an $S$-name $\dot{V}_\zeta$ such that

- $w_\zeta \models_S " \text{cl}_\tau(\dot{U}_{\alpha_{M_j}^{r}} \cap \dot{V}_\zeta) = \emptyset \text{ and } \delta \in \dot{V}_\zeta "$,
- for every $\zeta' \in k$, $w_\zeta \models_S " \psi_{w_\zeta, w_{\zeta'}}(\dot{V}_\zeta) \text{ is open in } \dot{\tau} "$, and
- $w_{\zeta + 1} \models_S " \dot{V}_{\zeta + 1} \subseteq \psi_{w_\zeta, w_{\zeta + 1}}(\dot{V}_\zeta) "$.

This can be done by our special property of $\dot{\tau}$ in the proposition \footnote{This is the only point in which the property of $\dot{\tau}$ is used in the proof.}.\footnote{This is the only point in which the property of $\dot{\tau}$ is used in the proof.}
We take $\beta_0 \in Y_0$ such that some extension of $w_0$ forces that \(\beta_0 \in \psi_{w_{k-1},w_0}(V_{k-1})\). Then for every $\zeta \in k$,

\[
w_\zeta \Vdash \beta_0 \in \psi_{w_{k-1},w_\zeta}(V_{k-1}) \subseteq V_\zeta, \text{ hence } \beta_0 \notin \dot{U}_{\alpha_{M_j}^r}.
\]

Since $\beta_0 \in Y_0 \subseteq \omega_1 \cap N \subseteq M_j^r$ and $t_{M_j}^r \leq _S w_\zeta$, by the definition of conditions of $\mathbb{P}$, for every $j \in b_i$,

\[
t_{M_j}^r \Vdash \beta_0 \notin \dot{U}_{\alpha_{M_j}^r},
\]

which is what we want. \(\dashv\) (Claim 2.2)

By repeating this procedure, we can take $s_3 \in S \cap N$ and a cofinal branch $\langle \beta_i; i \in n - m \rangle$ through $T_{s_3}^r$ such that $s_2 \leq s \leq s_1 (\leq s u)$ and for every $i \in n - m$ and $j \in b_{m+i}$,

\[
t_{M_j}^r \Vdash \beta_i \notin \dot{U}_{\alpha_{M_j}^r},
\]

Since $\langle \beta_i; i \in n - m \rangle \in T_{s_3}^r \cap N \subseteq T_{s_3} \cap N$, there exists $p_3 \in \mathbb{P} \cap N$ which is its witness. Then $\langle p_3, s_3 \rangle \in \mathcal{D} \cap N$ and $\langle r \cup p_3, u \rangle$ is a common extension of $\langle r, u \rangle$ and $\langle p_3, s_3 \rangle$, which finishes the proof.

ACKNOWLEDGEMENTS

The author was participating in a Researcher Exchange Program between JSPS and NSERC in 2010 hosted by Franklin D. Tall from April to August 2010. Then the author take a personal lecture from Franklin D. Tall about his paper [15], and take a lecture from Paul B. Larson about his preprint [3]. I would like to thank them. And I would like to thank Stevo Todorcević for encouraging me about a study of PFA(S)[S].

I am thankful all the members of the Toronto set theory group, and to the staff of the Fields Institute. A special thanks to Franklin D. Tall for his hospitality during the visit.
