# ON SOME FACTORIZATION FORMULAS OF *K-k*-SCHUR FUNCTIONS

MOTOKI TAKIGIKU

ABSTRACT. We give some new formulas about factorizations of K-k-Schur functions  $g_{\lambda}^{(k)}$ , analogous to the k-rectangle factorization formula  $s_{(t^{k+1-t})\cup\lambda}^{(k)} = s_{(t^{k+1-t})}^{(k)} s_{\lambda}^{(k)}$  of k-Schur functions. Although the formula of the same form does not hold for K-k-Schur functions, we can prove that  $g_{R_t}^{(k)}$  divides  $g_{R_t\cup\lambda}^{(k)}$ , and in fact more generally that  $g_P^{(k)}$  divides  $g_{P\cup\lambda}^{(k)}$  for any multiple k-rectangles P and any k-bounded partition  $\lambda$ . We give the factorization formula of such  $g_P^{(k)}$  and the explicit formulas of  $g_{P\cup\lambda}^{(k)}/g_P^{(k)}$  in some cases.

# 1. INTRODUCTION

Let k be a positive integer. k-Schur functions  $s_{\lambda}^{(k)}$  and their K-theoretic analogues  $g_{\lambda}^{(k)}$ , which are called K-k-Schur functions, are symmetric functions parametrized by k-bounded partitions  $\lambda$ , namely by the weakly decreasing strictly positive integer sequences  $\lambda = (\lambda_1, \ldots, \lambda_l), l \in \mathbb{Z}_{>0}$ , whose terms are all bounded by k.

Historically, k-Schur functions were first introduced by Lascoux, Lapointe and Morse [LLM03], and subsequent studies led to several (conjectually equivalent) characterizations of  $s_{\lambda}^{(k)}$  such as the Pieri-like formula due to Lapointe and Morse [LM07], and Lam proved that k-Schur functions correspond to the Schubert basis of homology of the affine Grassmannian [Lam08]. Moreover it was shown by Lam and Shimozono that k-Schur functions play a central role in the explicit description of the Peterson isomorphism between quantum cohomology of the Grassmannian and homology of the affine Grassmannian up to suitable localizations [LS12].

These developments have analogues in K-theory. Lam, Schilling and Shimozono [LSS10] characterized the K-theoretic k-Schur functions as the Schubert basis of K-homology of the affine Grassmannian, and Morse [Mor12] investigated them from a conbinatorial viewpoint, giving their various properties including the Pieri-like formulas using affine set-valued strips (the form using cyclically decreasing words are also given in [LSS10]).

In this paper we start from this combinatorial characterization (see Definition 6) and show certain new factorization formulas of K-k-Schur functions.

Among the k-bounded partitions, those of the form  $(t^{k+1-t}) = (\underbrace{t, \ldots, t}_{k+1-t} =: R_t),$ 

 $1 \leq t \leq k$ , called *k*-rectangle, play a special role. In particular, if a *k*-bounded partition has the form  $R_t \cup \lambda$ , where the symbol  $\cup$  denotes the operation of concatenating the two sequences and reordering the terms in the weakly decreasing order,

takigiku@ms.u-tokyo.ac.jp.

then the corresponding k-Schur function has the following factorization property [LM07, Theorem 40]:

(1) 
$$s_{R_t \cup \lambda}^{(k)} = s_{R_t}^{(k)} s_{\lambda}^{(k)}.$$

T. Ikeda suggested that the K-k-Schur functions should also possess similar properties, including the divisibility of  $g_{R_t\cup\lambda}^{(k)}$  by  $g_{R_t}^{(k)}$ , and that it should be interesting to explore such properties. The present work is an attempt to materialize his suggestion.

We do show that  $g_{R_t}^{(k)}$  divides  $g_{R_t\cup\lambda}^{(k)}$  in the ring  $\Lambda^{(k)} = \mathbb{Z}[h_1,\ldots,h_k]$ , where  $h_i$  denotes the complete homogeneous symmetric functions of degree i, of which the K-k-Schur functions form a basis. However, unlike the case of k-Schur functions, the quotient  $g_{R_t\cup\lambda}^{(k)}/g_{R_t}^{(k)}$  is not a single term  $g_{\lambda}^{(k)}$  but, in general, a linear combination of K-k-Schur functions with leading term  $g_{\lambda}^{(k)}$ , namely in which  $g_{\lambda}^{(k)}$  is the only highest degree term. Even the simplest case where  $\lambda$  consists of a single part (r),  $1 \leq r \leq k$ , displays this phenomenon: we show that

(2) 
$$g_{R_t\cup(r)}^{(k)} = \begin{cases} g_{R_t}^{(k)} \cdot g_{(r)}^{(k)} & \text{(if } t < r), \\ g_{R_t}^{(k)} \cdot \left(g_{(r)}^{(k)} + g_{(r-1)}^{(k)} + \dots + g_{\varnothing}^{(k)}\right) & \text{(if } t \ge r) \end{cases}$$

(actually we have  $g_{(s)}^{(k)} = h_s$  for  $1 \le s \le k$ , and  $g_{\emptyset}^{(k)} = h_0 = 1$ ). So we may ask:

**Question 1.** Which  $g_{\mu}^{(k)}$ , besides  $g_{\lambda}^{(k)}$ , appear in the quotient  $g_{R_t \cup \lambda}^{(k)}/g_{R_t}^{(k)}$ ? With what cofficients?

A k-bounded partition can always be written in the form  $R_{t_1} \cup \cdots \cup R_{t_m} \cup \lambda$  with  $\lambda$  not having so many repetitions of any part as to form a k-rectangle. In such an expression we temporarily call  $\lambda$  the remainder. Proceeding in the direction of Question 1, one ultimate goal may be to give a factorization formula in terms of the k-rectangles and the remainder. In the case of k-Schur functions, the straightforward factorization in (1) above leads to the formula  $s_{R_{t_1}}^{(k)} \cdots \cup R_{t_m} \cup \lambda = s_{R_{t_1}}^{(k)} \cdots s_{R_{t_m}}^{(k)} g_{\lambda}^{(k)}$ . On the contrary, with K-k-Schur functions, the simplest case having a multiple k-rectangle gives

(3) 
$$g_{R_t \cup R_t}^{(k)} = g_{R_t}^{(k)} \sum_{\lambda \subset R_t} g_{\lambda}^{(k)}.$$

Hence we cannot expect  $g_{R_t \cup R_t}^{(k)}$  to be divisible by  $g_{R_t}^{(k)}$  twice. Instead, upon organizing the part consisting of k-rectangles in the form  $R_{t_1}^{a_1} \cup \cdots \cup R_{t_m}^{a_m}$  with  $t_1 < \cdots < t_m$ and  $a_i \ge 1$   $(1 \le i \le m)$ , with  $R_t^a = \underbrace{R_t \cup \cdots \cup R_t}_{t_1}$ , actually we show that

$$g^{(k)}_{R^{a_1}_{t_1}\cup\cdots\cup R^{a_m}_{t_m}\cup\lambda}$$
 is divisible by  $g^{(k)}_{R^{a_1}_{t_1}\cup\cdots\cup R^{a_m}_{t_m}}$ 

which actually holds whether or not  $\lambda$  is the remainder. Then we can subdivide our goal as follows:

**Question** 1'. Which  $g_{\mu}^{(k)}$ , besides  $g_{\lambda}^{(k)}$ , appear in the quotient  $g_{P\cup\lambda}^{(k)}/g_P^{(k)}$  where  $P = R_{t_1}^{a_1} \cup \cdots \cup R_{t_m}^{a_m}$ , and with what coefficients?

Question 2. How can  $g_{R_{t_1}^{a_1} \cup \cdots \cup R_{t_m}^{a_m}}^{(k)}$  be factorized?

In this paper, we give a reasonably complete answer to Question 2 (Theorem 12), and partial answers to Question 1' (Theorem 13, 14 and 15). The full paper will be published elsewhere.

# 2. Preliminaries

In this section we review some requisite combinatorial backgrounds. First recall that the Pieri rule characterizes Schur functions. In the theory of (K)-k-Schur functions, the underlying combinatorial objects are the set of k-bounded partitions (instead of partitions), which is isomorphic to the set of (k+1)-cores, and we have to consider weak strips instead of horizontal strips. For detailed definitions, see for instance [LLM<sup>+</sup>14, Chapter 2] or [Mac95, Chapter I].

2.1. Partitions and Schur functions. Let  $\mathcal{P}$  denote the set of partitions. A partition  $\lambda = (\lambda_1 \ge \lambda_2 \ge \dots) \in \mathcal{P}$  is identified with its Young diagram (or shape), for which we use the French notation here.

the Young diagram of (4, 2)

We denote the size of a partition  $\lambda$  by  $|\lambda|$ , the length by  $l(\lambda)$ , and the conjugate by  $\lambda'$ . For partitions  $\lambda$ ,  $\mu$  we say  $\lambda \subset \mu$  if  $\lambda_i \leq \mu_i$  for all *i*. For a partition  $\lambda$  and a cell c = (i, j) in  $\lambda$ , we denote the hook length of c in  $\lambda$  by  $\text{hook}_c(\lambda) = \lambda_i + \lambda'_j - i - j + 1$ .

For a partition  $\lambda$ , a removable corner of  $\lambda$  (or  $\lambda$ -removable corner) is a cell  $(i,j) \in \lambda$  with  $(i,j+1), (i+1,j) \notin \lambda$ .  $(i,j) \in (\mathbb{Z}_{>0})^2 \setminus \lambda$  is said to be an addable corner of  $\lambda$  (or  $\lambda$ -addable corner) if  $(i, j - 1), (i - 1, j) \in \lambda$  with the understanding that  $(0, j), (j, 0) \in \lambda$ .

Let  $\Lambda = \mathbb{Z}[h_1, h_2, ...]$  be the ring of symmetric functions, generated by the complete symmetric functions  $h_r = \sum_{i_1 \leq i_2 \leq \cdots \leq i_r} x_{i_1} \cdots x_{i_r}$ . The Schur functions  $\{s_\lambda\}_{\lambda \in \mathcal{P}}$  are the family of symmetric functions satisfying

the Pieri rule:  $h_r s_{\lambda} = \sum s_{\mu}$ , summed over  $\mu$  such that  $\mu/\lambda$  is a horizontal r-strip.

2.2. Bounded partitions, cores and k-rectangles  $R_t$ . A partition  $\lambda$  is called k-bounded if  $\lambda_1 \leq k$ . Let  $\mathcal{P}_k$  be the set of all k-bounded partitions. An r-core (or simply a core if no confusion can arise) is a partition none of whose cells have a hook length equal to r. We denote by  $C_r$  the set of all r-core partitions.

Hereafter we fix a positive integer k.

For a cell c = (i, j), the content of c is j - i and the residue of c is res(c) = j - imod  $(k+1) \in \mathbb{Z}/(k+1)$ . For a set X of cells, we write  $\operatorname{Res}(X) = \{\operatorname{res}(c) \mid c \in X\}$ . We will write a  $\lambda$ -removable corner of residue *i* simply a  $\lambda$ -removable *i*-corner. For simplicity of notation, we may use an integer to represent a residue, omitting "mod (k+1)".

We denote by  $R_t$  the partition  $(t^{k+1-t}) = (t, t, \dots, t) \in \mathcal{P}_k$  for  $1 \le t \le k$ , which is called a k-rectangle. Naturally a k-rectangle is a (k+1)-core.

Now we recall the bijection between the k-bounded partitions in  $\mathcal{P}_k$  and the (k+1)-cores in  $\mathcal{C}_{k+1}$ : The map  $\mathfrak{p} \colon \mathcal{C}_{k+1} \longrightarrow \mathcal{P}_k; \kappa \mapsto \lambda$  is defined by  $\lambda_i = \#\{j \mid k \in \mathcal{C}\}$  $(i,j) \in \kappa$ , hook $_{(i,j)}(\kappa) \leq k$ . Then in fact  $\mathfrak{p}$  is bijective and we put  $\mathfrak{c} = \mathfrak{p}^{-1}$ . See [LM05, Theorem 7] for details. Note that if  $\lambda$  is contained in a k-rectangle then  $\lambda \in \mathcal{P}_k$  and  $\lambda \in \mathcal{C}_{k+1}$ , and besides  $\mathfrak{p}(\lambda) = \lambda = \mathfrak{c}(\lambda)$ .

For i = 0, 1, ..., k, an action  $s_i$  on  $\mathcal{C}_{k+1}$  is defined as follows: For  $\kappa \in \mathcal{C}_{k+1}$ ,

- if there is a  $\kappa$ -addable *i*-corner, then let  $s_i \cdot \kappa$  be  $\kappa$  with all  $\kappa$ -addable *i*-corners added,
- if there is a  $\kappa$ -removable *i*-corner, then let  $s_i \cdot \kappa$  be  $\kappa$  with all  $\kappa$ -removable *i*-corners removed,
- otherwise, let  $s_i \cdot \kappa$  be  $\kappa$ .

In fact first and second case never occur simultaneously and  $s_i \cdot \kappa \in \mathcal{C}_{k+1}$ .

2.3. Weak order and weak strips. We review the weak order on  $\mathcal{C}_{k+1}$ .

**Definition 1.** The weak order  $\prec$  on  $\mathcal{C}_{k+1}$  is defined by the following covering relation:

 $\tau \prec \kappa \iff \exists i \text{ such that } s_i \tau = \kappa, \tau \subsetneq \kappa.$ 

**Definition 2.** For (k + 1)-cores  $\tau \subset \kappa \in C_{k+1}$ ,  $\kappa/\tau$  is called a weak strip of size r (or a weak r-strip) when

 $\kappa/\tau$  is horizontal strip and  $\tau \prec \exists \tau^{(1)} \prec \ldots \prec \exists \tau^{(r)} = \kappa$ .

2.4. k-Schur functions. We recall a characterization of k-Schur functions given in [LM07], since it is a model for and has a relationship with K-k-Schur functions.

**Definition 3** (k-Schur function via "weak Pieri rule"). k-Schur functions  $\{s_{\lambda}^{(k)}\}_{\lambda \in \mathcal{P}_{k}}$ are the family of symmetric functions such that  $s_{\alpha}^{(k)} = 1$  and

$$h_r s^{(k)}_\lambda = \sum_\mu s^{(k)}_\mu \quad \textit{for } r \leq k \textit{ and } \mu \in \mathcal{P}_k,$$

summed over  $\mu \in \mathcal{P}_k$  such that  $\mathfrak{c}(\mu)/\mathfrak{c}(\lambda)$  is a weak strip of size r.

In fact  $\{s_{\lambda}^{(k)}\}_{\lambda \in \mathcal{P}_k}$  forms a basis of  $\Lambda^{(k)} = \mathbb{Z}[h_1, \ldots, h_k] \subset \Lambda$ . In addition  $s_{\lambda}^{(k)}$  is homogeneous of degree  $|\lambda|$ . It is proved in [LM07, Theorem 40] that

**Proposition 4** (k-rectangle property). For  $1 \leq t \leq k$  and  $\lambda \in \mathcal{P}_k$ , we have  $s_{R_t\cup\lambda}^{(k)} = s_{R_t}^{(k)} s_{\lambda}^{(k)} (= s_{R_t} s_{\lambda}^{(k)}).$ 

2.5. *K-k*-Schur functions  $g_{\lambda}^{(k)}$ . In [Mor12] a combinatorial characterization of *K-k*-Schur functions is given via an analogue of the Pieri rule, using some kind of strips called *affine set-valued strips*.

For a partition  $\lambda$ ,  $(i, j) \in (\mathbb{Z}_{>0})^2$  is called  $\lambda$ -blocked if  $(i + 1, j) \in \lambda$ .

**Definition 5** (affine set-valued strip). For  $r \leq k$ ,  $(\gamma/\beta, \rho)$  is called an affine setvalued strip of size r (or an affine set-valued r-strip) if  $\rho$  is a partition and  $\beta \subset \gamma$ are cores both containing  $\rho$  such that

- (1)  $\gamma/\beta$  is a weak (r-m)-strip where we put  $m = \#\text{Res}(\beta/\rho)$ ,
- (2)  $\beta/\rho$  is a subset of  $\beta$ -removable corners,
- (3)  $\gamma/\rho$  is a horizontal strip,
- (4) For ∀i ∈ Res(β/ρ), all β-removable i-corners which are not γ-blocked are in β/ρ.

In this paper we employ the following characterization [Mor12, Theorem 48] of the K-k-Schur function as its definition.

**Definition 6** (K-k-Schur function via an "affine set-valued" Pieri rule). K-k-Schur functions  $\{g_{\lambda}^{(k)}\}_{\lambda \in \mathcal{P}_k}$  are the family of symmetric functions such that  $g_{\emptyset}^{(k)} = 1$  and for  $\lambda \in \mathcal{P}_k$  and  $0 \leq r \leq k$ ,

(4) 
$$h_r \cdot g_{\lambda}^{(k)} = \sum_{(\mu,\rho)} (-1)^{|\lambda|+r-|\mu|} g_{\mu}^{(k)},$$

summed over  $(\mu, \rho)$  such that  $(\mathfrak{c}(\mu)/\mathfrak{c}(\lambda), \rho)$  is an affine set-valued strip of size r.

In fact  $\{g_{\lambda}^{(k)}\}_{\lambda \in \mathcal{P}_k}$  forms a basis of  $\Lambda^{(k)}$ . Moreover, though  $g_{\lambda}^{(k)}$  is an inhomogeneous symmetric function in general, the degree of  $g_{\lambda}^{(k)}$  is  $|\lambda|$  and its homogeneous part of highest degree is equal to  $s_{\lambda}^{(k)}$ .

3. Results

3.1. Possibility of factoring out  $g_{R_{t_1}^{a_1}\cup\cdots\cup R_{t_m}^{a_m}}^{(k)}$  and some other general results. As discussed above, it does not hold that  $g_{R_t\cup\lambda}^{(k)} = g_{R_t}^{(k)}g_{\lambda}^{(k)}$  for any  $\lambda \in \mathcal{P}_k$ . However, it holds that  $g_{R_t}^{(k)}$  divides  $g_{R_t\cup\lambda}^{(k)}$ . We prove it in a slightly more general form.

The following notation is often referred later:

(NP) Let  $1 \leq t_1, \ldots, t_m \leq k$  be distinct integers and  $a_i \in \mathbb{Z}_{>0}$   $(1 \leq i \leq m)$ , where  $m \in \mathbb{Z}_{>0}$ . Then we put

$$egin{aligned} P &= R_{t_1}^{a_1} \cup \cdots \cup R_{t_m}^{a_m}, \ lpha P(u) &= \#\{t_v \mid 1 \leq v \leq m, \ t_v \geq u\} \quad ext{for each } u \in \mathbb{Z}_{>0}. \end{aligned}$$

**Proposition 7.** Let P be as in the above (NP). Then, for  $\lambda = (\lambda_1, \dots, \lambda_l) \in \mathcal{P}_k$ , we have  $g_P^{(k)}|g_{\lambda \cup P}^{(k)}$  in the ring  $\Lambda^{(k)}$ .

*Remark.* Note that  $\lambda$  may still have the form  $\lambda = R_t \cup \mu$ . Hereafter we will not repeat the same remark in similar statements.

Since the homogeneous part of highest degree of  $g_{\lambda}^{(k)}$  is equal to  $s_{\lambda}^{(k)}$  for any  $\lambda$ , it follows from Propositions 4 and 7 that

**Corollary 8.** Let P be as in (NP). Then, for any  $\lambda \in \mathcal{P}_k$ , we can write

$$g_{P\cup\lambda}^{(k)}=g_P^{(k)}\left(g_\lambda^{(k)}+\sum_\mu a_{\lambda\mu}g_\mu^{(k)}
ight),$$

summing over  $\mu \in \mathcal{P}_k$  such that  $|\mu| < |\lambda|$ , for some coefficients  $a_{\lambda\mu}$  (depending on P).

Now we are interested in finding a explicit description of  $g_{P\cup\lambda}^{(k)}/g_P^{(k)}$ . Let us consider the case  $P = R_t$  for simplicity.

As noted above, a linear map  $\Theta$  extending  $g_{\lambda}^{(k)} \mapsto g_{R_t \cup \lambda}^{(k)}$  ( $\forall \lambda \in \mathcal{P}_k$ ) does not coincide with the multiplication of  $g_{R_t}^{(k)}$  because it does not commute with the multiplication by  $h_r$  in the first place.

However, we can prove that the restriction of  $\Theta$  to the subspace spanned by  $\{g_{R_t\cup\mu}^{(k)}\}_{\mu\in\mathcal{P}_k}$  (in fact this is the principal ideal generated by  $g_{R_t}^{(k)}$ ) commutes with the multiplication by  $h_r$ , and thus it coincides with the multiplication of  $\Theta(g_{R_t}^{(k)})/g_{R_t}^{(k)} =$ 

 $g_{R_t \cup R_t}^{(k)}/g_{R_t}^{(k)}$  on that ideal (Proposition 9). Thus it is of interest to describe the value of  $g_{R_t \cup R_t}^{(k)}/g_{R_t}^{(k)}$ , which is shown to be  $\sum_{\nu \subset R_t} g_{\nu}^{(k)}$  later.

**Proposition 9.** For  $\lambda \in \mathcal{P}_k$  and  $1 \le t \le k$ , we have  $g_{\lambda \cup R_t \cup R_t}^{(k)} = g_{\lambda \cup R_t}^{(k)} \cdot \frac{g_{R_t \cup R_t}^{(k)}}{g_{R_t}^{(k)}}$ .

As a corollary, it turns out that the value of  $g_{P\cup\lambda}^{(k)}/g_P^{(k)}$  is independent of  $a_1,\ldots,a_m$ , the "multiplicities" of k-rectangles.

**Theorem 10.** Let  $P = R_{t_1}^{a_1} \cup \cdots \cup R_{t_m}^{a_m}$  be as in (NP), and put  $Q = R_{t_1} \cup \cdots \cup R_{t_m}$ . Then, for  $\lambda \in \mathcal{P}_k$  we have

$$\frac{g_{P\cup\lambda}^{(k)}}{g_P^{(k)}} = \frac{g_{Q\cup\lambda}^{(k)}}{g_Q^{(k)}}.$$

Thus we can reduce Question 1' to the case where the k-rectangles are of all different sizes.

3.2. Answer to Question 2. For Question 2, we first show that multiple k-rectangles of different sizes entirely split, namely,

**Theorem 11.** For  $1 \le t_1 < \cdots < t_m \le k$  and  $a_1, \ldots, a_m > 0$ ,

$$g^{(k)}_{R^{a_1}_{t_1}\cup\cdots\cup R^{a_m}_{t_m}}=g^{(k)}_{R^{a_1}_{t_1}}\cdots g^{(k)}_{R^{a_m}_{t_m}}.$$

Then we show that for each  $1 \le t \le k$  and a > 1, we have a nice factorization generalizing the formula (3):

**Theorem 12.** For  $1 \le t \le k$  and a > 0, we have

$$g_{R_t^a}^{(k)} = g_{R_t}^{(k)} \left(\sum_{\lambda \subset R_t} g_{\lambda}^{(k)}\right)^{a-1}$$

Thus, substituting this into Theorem 11, we have

$$g_{R_{t_1}^{a_1} \cup \dots \cup R_{t_n}^{a_n}}^{(k)} = g_{R_{t_1}}^{(k)} \left( \sum_{\lambda^{(1)} \subset R_{t_1}} g_{\lambda^{(1)}}^{(k)} \right)^{a_1 - 1} \dots g_{R_{t_n}}^{(k)} \left( \sum_{\lambda^{(n)} \subset R_{t_n}} g_{\lambda^{(n)}}^{(k)} \right)^{a_n - 1}$$

3.3. (Partial) Answer to Question 1'. An easiest case is where  $\lambda = (r)$  consists of a single part, which generalizes the case (2) in Introduction. Namely we show that

**Theorem 13.** Let  $P, \alpha_P(u)$  be as in (NP) and  $1 \le r \le k$ . Then we have

$$\frac{g_{P\cup(r)}^{(\kappa)}}{g_P^{(k)}} = \sum_{s=0}^r \binom{\alpha_P(r) + r - s - 1}{r - s} h_s.$$

In particular, if  $t_m < r$ , which means  $\alpha_P(r) = 0$ , we have

/• \

$$\frac{g_{P\cup(r)}^{(k)}}{g_P^{(k)}} = h_r = g_{(r)}^{(k)}$$

On the other hand, when m = 1,

$$\frac{g_{R_t \cup (r)}^{(k)}}{g_{R_t}^{(k)}} = \begin{cases} h_r & \text{(if } r > t), \\ h_r + h_{r-1} + \dots + h_0 & \text{(if } r \le t). \end{cases}$$

Then generalizing this case, we derive explicit formulas in the cases where  $\lambda = (\lambda_1, \ldots, \lambda_l)$  satisfies the following condition  $(N\lambda)$  and that the parts of  $\lambda$  except for  $\lambda_l$  are all larger than the widths of the k-rectangles.

(N $\lambda$ ) Let  $(\emptyset \neq)\lambda \in \mathcal{P}_k$  with satisfying  $\overline{\lambda} \subset R'_{\overline{l}}$ , where we write  $\overline{\lambda} = (\lambda_1, \lambda_2, \dots, \lambda_{l(\lambda)-1})$ ,  $l = l(\lambda)$  and  $\overline{l} = l(\overline{\lambda}) = l-1$ . (Here we consider  $R_t$  to be  $\emptyset$  unless  $1 \leq t \leq k$ )

(*Note*: when  $l(\lambda) = 1$ , we have  $\bar{l} = 0$  and  $\bar{\lambda} = \emptyset = R'_{\bar{l}}$  thus  $\lambda$  satisfies (N $\lambda$ ). When  $l(\lambda) > k + 1$ , we have  $\bar{l} > k$  and  $\bar{\lambda} \neq \emptyset = R'_{\bar{l}}$  thus  $\lambda$  does not satisfy (N $\lambda$ ).)

Namely, we prove that

**Theorem 14.** Let P and  $\alpha_P(u)$  (for  $u \in \mathbb{Z}_{>0}$ ) be as in (NP)in Section 3.1, before Proposition 7. Let  $\lambda, l, \overline{\lambda}, \overline{l}$  be as in (N $\lambda$ )above. Assume  $\max_{i} \{t_i\} < \overline{\lambda}_{\overline{l}}$ . Then we have

(1) 
$$g_P^{(k)}g_{\lambda}^{(k)} = \sum_{s=0}^{\lambda_l} (-1)^s \binom{\alpha_P(\lambda_l+1-s)}{s} g_{P\cup\bar{\lambda}\cup(\lambda_l-s)}^{(k)}$$

(2) 
$$g_{P\cup\lambda}^{(k)} = g_P^{(k)} \sum_{s=0}^{\lambda_l} \binom{\alpha_P(\lambda_l) + s - 1}{s} g_{\overline{\lambda}\cup(\lambda_l-s)}^{(k)}.$$

In particular, if  $t_n < \lambda_l$  then  $\alpha_P(\lambda_l) = 0$  and

$$g_{P\cup\lambda}^{(k)} = g_P^{(k)} g_\lambda^{(k)}.$$

Moreover, we show a formula in a slightly different case where P is a single k-rectangle  $R_t$  and  $\lambda = (\lambda_1, \ldots, \lambda_l)$  satisfies  $(N\lambda)$  and that the parts of  $\lambda$  except for  $\lambda_l$  are all larger than or equal to the widths of the k-rectangles.

Notation. For any partition  $\lambda$ , let  $\lambda^{\circ} = (\lambda_1, \ldots, \lambda_i)$  if  $\lambda_i > t \ge \lambda_{i+1}$  (we set  $\lambda^{\circ} = \emptyset$  if  $t \ge \lambda_1$ ).

**Theorem 15.** Let  $\lambda, l, \overline{\lambda}, \overline{l}$  be as in (N $\lambda$ ). Assume  $\overline{\lambda}_{\overline{l}} \ge t \ge \lambda_l$ . Then we have

$$g_{R_t\cup\lambda}^{(k)}=g_{R_t}^{(k)}\sum_{\mathfrak{c}(\lambda^\circ)\subset\mathfrak{c}(\nu)\subset\mathfrak{c}(\lambda)}g_\nu^{(k)}.$$

#### MOTOKI TAKIGIKU

3.4. **Example.** Let us illustrate the sketch of the proof of Theorem 14 with a small example.

Consider the case  $P = R_t$ : we shall show that  $g_{R_t \cup \lambda}^{(k)} = g_{R_t}^{(k)} g_{\lambda}^{(k)}$  if  $\lambda_l > t$  and  $\lambda_1 + l \le k + 2$ . Let us assume Theorem 13 (the case l = 1) and consider the case l = 2. Set  $\lambda = (a, b)$  with  $k \ge a \ge b > t$ .

<u>Step (A)</u>: Expand  $g_{(a,b)}^{(k)}$  into a linear combination of products of complete symmetric functions and *K-k*-Schur functions labeled by partitions with fewer rows:

By using the Pieri rule (4) we have

$$g_{(a)}^{(k)}h_{i} = \left(g_{(a,i)}^{(k)} - g_{(a,i-1)}^{(k)}\right) \\ + \left(g_{(a+1,i-1)}^{(k)} - g_{(a+1,i-2)}^{(k)}\right) \\ + \dots \\ \left\{ \begin{array}{l} \dots + \left(g_{(a+i-1,1)}^{(k)} - g_{(a+i-1,0)}^{(k)}\right) \\ + g_{(a+i,0)}^{(k)} \\ \dots + \left(g_{(k-1,a+i-k+1)}^{(k)} - g_{(k-1,a+i-k)}^{(k)}\right) \\ + \left(g_{(k,a+i-k)}^{(k)} - g_{(k,a+i-k-1)}^{(k)}\right) \end{array} \right.$$
(if  $a + i > k$ )

for  $i \leq a$ , and summing this over  $0 \leq i \leq b$ , we have

(5) 
$$g_{(a)}^{(k)}(h_b + \dots + h_0) = g_{(a,b)}^{(k)} + g_{(a+1,b-1)}^{(k)} + \dots \begin{cases} g_{(a+b,0)}^{(k)} & (\text{if } a+b \le k) \\ g_{(k,a+b-k)}^{(k)} & (\text{if } a+b \ge k) \end{cases}$$
$$= \sum_{\substack{\mu/(a): \text{horizontal strip}\\ |\mu| = a+b\\ \mu_1 \le k}} g_{\mu}^{(k)}.$$

Similarly we have

$$g_{(a+1)}^{(k)}(h_{b-1} + \dots + h_0) = g_{(a+1,b-1)}^{(k)} + g_{(a+2,b-2)}^{(k)} + \dots = \sum_{\substack{\mu/(a+1): \text{horizontal strip} \\ |\mu| = a+b \\ \mu_1 \le k}} g_{\mu}^{(k)},$$

hence

$$g_{(a,b)}^{(k)} = g_{(a)}^{(k)} \left( h_b + \dots + h_0 \right) - g_{(a+1)}^{(k)} \left( h_{b-1} + \dots + h_0 \right).$$

Step (B): Multiply  $g_{(a,b)}^{(k)}$  by  $g_{R_t}^{(k)}$ . Then we have

$$g_{R_t}^{(k)}g_{(a,b)}^{(k)} = g_{R_t}^{(k)}g_{(a)}^{(k)}(h_b + \dots + h_0) - g_{R_t}^{(k)}g_{(a+1)}^{(k)}(h_{b-1} + \dots + h_0)$$
  
=  $g_{R_t\cup(a)}^{(k)}(h_b + \dots + h_0) - g_{R_t\cup(a+1)}^{(k)}(h_{b-1} + \dots + h_0)$ 

because  $g_{R_t}^{(k)} g_{(a)}^{(k)} = g_{R_t \cup (a)}^{(k)}$  since t < a. Then carry out calculations similar to Step (A).

Notation. For a proposition P, we shall write  $\delta[P] = 1$  if P is true and  $\delta[P] = 0$ if P is false.

Since the number of residues of  $\mathfrak{c}(R_t \cup (a, j))$ -nonblocked  $\mathfrak{c}(R_t \cup (a))$ -removable corners is  $1 + \delta [t > j]$ ,

$$\begin{split} g_{R_{t}\cup(a)}^{(k)}h_{i} &= \left(g_{R_{t}\cup(a,i)}^{(k)} - \binom{1+\delta\left[t>i-1\right]}{1}g_{R_{t}\cup(a,i-1)}^{(k)} + \binom{1+\delta\left[t>i-2\right]}{2}g_{R_{t}\cup(a,i-2)}^{(k)}\right) \\ &+ \left(g_{R_{t}\cup(a+1,i-1)}^{(k)} - \binom{1+\delta\left[t>i-2\right]}{1}g_{R_{t}\cup(a+1,i-2)}^{(k)} + \binom{1+\delta\left[t>i-3\right]}{2}g_{R_{t}\cup(a+1,i-3)}^{(k)}\right) \end{split}$$

Summing this over  $0 \le i \le b$ , we have

$$g_{R_t\cup(a)}^{(k)}(h_b+\dots+h_0) = \left(g_{R_t\cup(a,b)}^{(k)} - \delta[t>b-1]g_{R_t\cup(a,b-1)}^{(k)}\right) \\ + \left(g_{R_t\cup(a+1,b-1)}^{(k)} - \delta[t>b-2]g_{R_t\cup(a+1,b-2)}^{(k)}\right) \\ + \dots$$

Similarly we have

$$g_{R_t\cup(a+1)}^{(k)}(h_{b-1}+\dots+h_0) = \left(g_{R_t\cup(a+1,b-1)}^{(k)}-\delta[t>b-2]g_{R_t\cup(a+1,b-2)}^{(k)}\right) \\ + \left(g_{R_t\cup(a+2,b-2)}^{(k)}-\delta[t>b-3]g_{R_t\cup(a+2,b-3)}^{(k)}\right) \\ + \dots,$$

hence we have

$$g_{R_t}^{(k)} g_{(a,b)}^{(k)} = g_{R_t \cup (a,b)}^{(k)} - \delta [t > b - 1] g_{R_t \cup (a,b-1)}^{(k)}$$
  
=  $g_{R_t \cup (a,b)}^{(k)}$ 

since we have assumed b > t.

### 4. DISCUSSIONS

It is worth noting that, in any cases we have seen,  $g_{P\cup\lambda}^{(k)}/g_P^{(k)}$  is written as a linear combination with *positive coefficients* of K-k-Schur functions:

**Conjecture 16.** For  $\forall \lambda \in \mathcal{P}_k$  and  $P = R_{t_1}^{a_1} \cup \cdots \cup R_{t_m}^{a_m}$ , write

$$g_{P\cup\lambda}^{(k)}=g_P^{(k)}\sum_\mu a_{P,\lambda,\mu}g_\mu^{(k)}$$

Then  $a_{P,\lambda,\mu} \geq 0$  for any  $\mu$ .

In the case  $P = R_t$ , it is observed that  $a_{R_t,\lambda,\mu} = 0$  or 1. Moreover, the set of  $\mu$  such that  $a_{R_t,\lambda,\mu} = 1$  is expected to be an "interval", but we have to consider the strong order on  $\mathcal{P}_k \simeq \mathcal{C}_{k+1}$ , which can be seen as just inclusion as shapes in the poset of cores. Namely, the strong order  $\lambda \leq \mu$  on  $\mathcal{P}_k$  is defined by  $\mathfrak{c}(\lambda) \subset \mathfrak{c}(\mu)$ . Notice that  $\lambda \preceq \mu \Longrightarrow \lambda \subset \mu \Longrightarrow \lambda \leq \mu$  for  $\lambda, \mu \in \mathcal{P}_k$ . Then,

**Conjecture 17.** For  $\forall \lambda \in \mathcal{P}_k$  and  $1 \leq \forall t \leq k$ , there exists  $\exists \mu \in \mathcal{P}_k$  such that

$$g_{R_t\cup\lambda}^{(k)}=g_{R_t}^{(k)}\sum_{\mu\leq
u\leq\lambda}g_
u^{(k)}.$$

It should be interesting to study the geometric meaning of these results and conjectures.
